Hello Mike,

This is quite a tall order, somewhat akin to plugging two RS232 modems into a single RS232 port.

It works like this; you have the MSTE keyboard which is the modem, and the Atari which is the RS232 port. And then the extra mouse you speak of has to be connected to the same RS232 port. It simply won't work because of handshaking. In that the signals for each device will conflict as the design is a direct communication protocol.

The only solution here would be an adapter board which manages and allows such handshaking.

I do have a hack idea to overcome this however but it would de-standardise the machine. That idea would be to dismantle your MSTE keyboard, wire up a PeST inside to the mouse port, replace the MSTE's cable with one containing a greater number of cores, run the PS2 DATA and CLOCK signals back to the where the cable plugs into the ST, and end up with a socket coming out of the lead where the keyboard plugs into the system unit.

Best of luck,

Aly

I have had a 1.2 Gig drive connected to an ST, which I carried around on contract assignments. At the moment I have a small number of 9.1 Gig drives, one of them connected to an adapter that fits it to a 50 pin bus, connected to a TT by its SCSI port. That 1.2 Gig drive has been connected to both an ST and an STe with both a Link and a Link97.

Maybe Uwe can answer, but it seems to me that if you terminate the lines on an 80 pin single-ended drive you are not using, it becomes a single ended 50 pin drive.

The way to test this would be a Link or Link2, which does not do negotiation, with a large drive. My adapter for using SCA drives comes from CS Electronics, ordered from their web site, and costs about a half a hundred dollars. $52, the last time I looked.

Someday I will find out for sure. Have a Link and a Link 97, and uses for
both of them, and an old unix home2 box with a worn-out drive in it, which
is what has been connected to a ST with a Link97.

19 pins does not appear to cause any problems with connecting a large
drive to an ST or STe.

Jim

I have a 2GB SCSI drive here, no termination, also cdrom and a second 1GB
SCSI drive, no problems here.

6 days is nothing, I ordered a book from the USA a few years ago (expensive
rare book I might add), took 8months to arrive from USA to UK.  But yeah, a
week is about typical, 2 weeks tops, time to worry is when the number roll
over into months ;-)

This one could be a toughie. Can anyone tell me where pin #1 is located on
the high and low TOS 2.06 ROM chips?

Thanks.

There ye go;
http://www.maplin.co.uk/Media/product_pdfs/aw34.pdf

Can't say fairer than that :-)

Just in case you're on an ST only and pdf's are a problem, the layout of this rather digested dram follows similar conventions, pin 1 is always upper left with the notch on the top;

```
      ------\_/------
   A8 |1          16| GND
    D |2          15| CAS
   WE |3          14| Q
  RAS |4          13| A6
   A0 |5          12| A3
   A2 |6          11| A4
   A1 |7          10| A5
  Vcc |8           9| A7
      ---------------
```

Hmph. You made that look too easy! <big grin>

Thanks though Alison! I've got a Compatibility Plus 2 board that I'm trying to figure out. I don't have any docs with it, and when it came time to insert the ROMs...well... I was just guessing and couldn't get it to work. I just hope I didn't kill my ROMs. According to Brad at Best Electronics, if I had them in the wrong way, I might have already destroyed them. :-(

Well, I guess that certainly has some advantages, eh? <big grin>

I've got mine ordered and paid for...just waiting... :-)

PS So do you think the Supervidel will be next? Thats something else that
me and a lot of other people are excited about!

Not sure if this helps (admittedly I know not alot about Thing).

Have just Googled and some text says here;

Dedicated icon manager.
This is now available as a separate English release from:
Download icon utility now!
http://atari.transaction.free.fr/interactive/software/thng120.htm

If you can't change the colour under the icons then can you not copy, edit, and replace the icons?
Thus achieving what you would like by coming in from a different angle.

Hi again, Ronald!

I think that Thomas is still active and have plans to continue work on Thing, but I also know that he is very busy elsewhere. So I have no idea when we will see a new Thing version. Thomas, if you read, can you say something about Thing development status?

Best Regards,
Odd Skancke

The problem isnt the icons themselves, it is how the icon banners are rendered. So it doesnt matter what you do to the icons, really :)

Best Regards,
Odd Skancke

What about the current version of NeoDesk. Can the white banner be
changed
to the background color?

Also, has anyone had any luck using another Font other than the system
Font with Current version of NeoDesk?
I use Current version of Geneva with it BTW.

If so, any details on what font and from what system SpeedOGDOS or NVDI?

Would like to buy the latest version of Jinnie.

Anyone here know what the last version was?

If anyone in the US has a version for sale do
contact me.

I may also purchase a new copy if it still can
be purchased.

Well, how about TeraDesk? Although it has the same behaviour it is as far as I know the only desktop that is still in active development.

And by the way, due to the fact that it is the only desktop that can handle very long filenames correctly I recently switched to it. In the beginning I missed some features but in the meantime I start getting used to it.

Regards,

Frank

Hello,

I read in a post a few days ago that there seems to exist a version of
thing > 1.27. Where can one get this version ?
BTW, I sent many mails to the authors of 1.27 in order to register a
long time ago, but never got any answer :-(

Regards,

Jean-Luc

Hello,

Have seen a few names from here pop up in my inbox over the last few weeks.
Thanks for supporting
the project :-) From what I'm hearing back it's all good. There's now
about 50+ of them out there.

For anyone that's interested in one of these PS2 mouse interfaces, they're
up on eBay here;
<http://cgi.ebay.co.uk/Atari-ST-PeST-PS2-Mouse-Interface_W0QQitemZ8710374530
>

I have the PCB's to make about 12 more before Chris/Exxos and I make the
decision to buy
another 100 boards depending on how the figures look.

Further details here;
http://www.retro.dial.pipex.com/pest/index.htm

Thanks again,

techie_a

I have 3 modules left here then thats all my stock out, problem is to buy stuff in packs of 25 to get good prices... problem is also there ain't 25 PCB's left. I can get some more made up again, though I have to sell 20 modules just to get back the cash invested on the PCB's alone... This is why the prices are going up at the moment and only buying in bulk packs is the cheapest solution.

http://www.cps-electronics.co.uk/web/PeST.htm

There are still a lot of PeST for sale, so I suggest if people want them to grab them while we have stocks of them. After they are gone we could go back to taking pre-orders though there will have to be at least 25 orders before the production goes ahead. either that or someone buys a bulk pack of 25, in which case it covers the costs of parts and don't leave me out of pocket then!

We know there are people in the states who can't get payment to use, We asked BEST if they would be interested in being a distributor and it was a no-go. Only thing we can suggest is if someone in the states buys a bulk pack and we can list them as a USA distributor for those who cant get payment overseas... It would be wise for "whoever" to get a list of people who wish to order one in effect taking pre-orders as I did last month before making the purchase. Its a lot of $$$ to invest in stock, though I am sure they will sell eventually. Its if anyone has a deep enough pocket to be a USA distributor!

We don't plan on pulling the plug on them anytime soon, we hope to keep them in production for a long time yet, but we have to be carefull that we don't end up out of pocket which is what happens when 100 people say they want one and only a handfull actually buy one, so I hope people can understand we are trying to be as fair as we can!

/end rant :-)

Chris

And well worth every penny too! I am now able to use even a usb optical
mouse on my STe, all thanks to PeST.

Promotion over! :)

Seriously 1600X1200 photos?

That would take a day or 2 to load on dial up! :D

I still got a problem with someone that has an opportunity to find items
like that but have no respect other than stacking it on end and never
bothering with it again. (sniff)

Have you tried Jinnee? I know it's a bit expensive compared to other alternatives, but it is able to change the color of the text background under the icons, like you want to do. It's probably the most feature-packed desktop I've seen on our platform, too.

Someone else suggested making this a request for the Teradesk authors, if you don't mind the much trimmed-down features. That might be a way to go as well, since it's the most actively developed desktop around. Personally, I've tried Teradesk, and after getting used to Thing and Jinnee, it drives me crazy not having all those features. I don't think I could ever switch to it unless they decide to make a non-slimmed-down version of that desktop, which would go against the author's intent. Of course, memory limitations and functioning extremely close to the built-in GEM desktop isn't an issue for me (not too fond of the basic GEM desktop anyway), and I like having as many options available to me as possible. So for you, this might not be a problem.

Everyone,

I have a carload of free ST stuff to give away.

STE1040, HD, two monitors, power supplys, books and software. Lots of software.

Can't see it thrown out - but my wife wants the garage back.

Deal is - you pay for shipping and you take it all.

I live in Calgary Alberta

Kel

It was in working condition about two months ago.

Been sitting in my garage since.

Bit dusty but it was working. Not sure of the external HD - never
tried it. First five games started and worked. Both monitors were
working. Never tried the external floppy drives.

Well I think you don�t need UNPACKER, what for?

Just need to get properly QUAKE VERSION, and put PAK files into ID1 FOLDER
if I good remember.

I'm in the same situation. I have tried contacting the author etc to no
avail. I would like to get a registered version of Thing be it 1.27e or
preferably later!

Hello,

I'd like to buy an external working Atari hard drive in the UK, supplied with a 19DB cable. Size in megabytes not hugely important. Atari stock preferred although Supra, Triangle, Power Computing all good.

Offer is upto �50inc P+P. payable via PayPal.

Thanks,

techie_a

Yes I have already bought one. I am using Mario Becroft's device on my Hades so I can use a serial mouse, but want the PeST just in case something goes wrong. I love my ST's, but the Atari mouse has not always been my favorite. Even on my STe I have Dexa Mouse that was converted by a friend of mine.

U should ask Thomas for 1.29 beta then. It was not released, but he was happy to send a copy to registered users on request. Better (not perfect still) long names support, image background in windows ... I use it, and im quite happy with it.

Which I did numerous times. The last time I send a mail to Thomas was
```

maybe two months ago but alas for some reason he doesn't reply at all.

This means that I need to register first, which I *never* could achieve
at all :-(
So, what do I do now ?

Thanks,

Jean-Luc

Hi Paul, Henk and Edward :-)

Good to hear that you're getting on well. Hope you've all tried holding

both mouse buttons for 10 seconds to try out the different scaling speeds.
A customer a few days ago was over the moon at the suggestion, I'm not quite sure what happened to him after that.

Yayyyyy, the PeST club. Erm, well maybe not.

Friendly hellos,

techie_a

We try ;-)

Just trying to do all of the nitty searching for this project to begin with.

A TOS transparant ACSI <> IDE adapter, ooh yummy. for my tummy. well
something like that.. that just didn't sound right.

Maybe I am eccentric not to have a television, try it in the UK and see what
happens to you non-conformists out there.
http://www.marmalade.net/lime/

They REALLY (the BBC) do treat you like this in the UK. If you don't want
to watch adverts and the latest celebrities ad-nausea you're considered
strange.

There are two 4.1 versions. (Yes, I know that doesn't make sense.)
You can tell the difference by the date on the splash screen. You want
April 18th, 1991.

Galen

I don't watch TV either, having the time would be a fine thing! I'm
actually happy listening to the local radio station, they get a lot of
E-mails from me during the day, entering the quizes with silly answers is
always a good laugh... I know im simple ;-)

Chris

I'm pretty sure that NeoDesk can use any font, but I don't think the
background color can be changed.

Note however, that most fonts don't display well when in the tiny
fontsize that an icon requires.

Hi,

To reiterate, I need a hard disk as specfied, as in an ACSI drive, not an internal fitted IDE drive or cartridge rom;

I'd like to buy an external working Atari hard drive in the UK, supplied with a 19DB cable. Size in megabytes not hugely important. Atari stock preferred although Supra, Triangle, Power Computing all good.

Offer is upto ?50inc P+P. payable via PayPal.

Thanks,

techie_a

Hey gang. I was just wondering...doesn't the CT60 work with RGB (as in SC1224 monitors)?

Reason I'm asking is, I was playing with some older demos, seeing which ones still work and which ones don't. I was running at first with the CT60 turned *off*. Some demos work, some don't - so I can only assume its because of the motherboard mod thats done. Termfin runs, Beams runs, Hmm runs, but none of the Douglas Litte (of Black Scorpion fame) demos like Speeder work.

Anyways, I ran beams from ST low, no auto/acc/cpx stuff at all. It runs, and says it found no CT60, no Centurbo, no...well, you get the idea. It seems it detects some of these upgrades so I thought I'd boot up with the CT60 *on*, hooked up to an SC1224 monitor, in st-low, no auto/accs/cpxs and see what it would do.

Except that I can't even boot up. The screen goes garbled up color crazy and thats it. Nothing. Nada.

Am I missing (as per my usual practice <grin>) something obvious here? :-)

Thanks guys.

>Well, how about TeraDesk?

TeraDesk simply the AES function rsrc_load() to read the icons file and then uses objc_draw()/_add()/_change()/_hide()... to draw and manipulate them. So the most elegant way to provide transparent icon labels would be that an AES somehow provide that capability. Alternative code might be created to provide enhanced rendering of the icons, e.g. like transparent labels, or proper drawing of 'disabled' icons (nice for for hidden files), but probably that would be more trouble than it would be useful. On the other hand, if someone wishes to contribute a piece of very small (up to a couple of hundred bytes) and fast piece of icon-rendering code (treating icons as progdef'd objects), it may get included in TeraDesk...

>as far as I know the only desktop that is still in active development.

A new release of TeraDesk (V3.63) can be expected in a couple of weeks or so- a number corrections has been made, some of which which may be considered more as improvements of the functionality of certain features. See new.txt on TeraDesk's home page.

>And by the way, due to the fact that it is the only desktop that can
>handle very long filenames correctly I recently switched to it.

I must admit that I do not understand this fascination with very long filenames ;) OK, the 8+3 of FAT filesystem is really very limiting, but extremely long names are boring to type, difficult to identify, and make directory listings almost unreadable. IMO about 10-20 characters should be enough- the useful content is supposed to be -in- the files, not in their names.

Btw. TeraDesk can handle filenames up to 128 characters long and complete paths can be up to 255 characters long, (but in some situations the complete path may be limited to about 130 characters).

Bbtw. it is possible to change maximum name/path length in TeraDesk by changing only three parameters in the source code- so a user should be able to easily recompile the program with this feature set to his liking (recently a user wished for filenames up to at least 1024 characers long...).

>In the beginning I missed some features but in the meantime I start getting
>used to it.

People have contacted me with very useful remarks about features which did not work as declared, or missing features which would be useful. Some of those suggestions have since been implemented in TeraDesk- so, if you have some specific objections, please let me know, and maybe something can be done about them.

Regards;

Djordje

I had similar problems when I clocked the bus with nemesis years ago. Some games didn't work at all, the screen was just garbage and rolling like mad, worked fine on a unclocked falcon... actually got tired of it after a few games and ripped the thing out... I have CT60, and needless to say ive not boosted any buses up... only one that might be worth doing is the dsp clock..... I just overall get the feeling that people haven't tested these bus upgrades out properly as indeed it causes stuff to mess up... even know of some falcons which have been killed due to overclocking, seems the videl gives up or something like that.... im staying well clear of all that stuff now! not worth gaining a few mhz at the risk of killing a falcon!!!!!

my 2c worth.....

chris

Hi Chris. I had the Nemesis accelerator in my first Falcon. It was very
compatible for me. All the demos, games, and apps that I used worked just
fine.

Don't know whats different about the motherboard mod for the CT60 but it is. About 1/3 of the demos I've tried so far don't work (this is with the CT60 itself turned off). Some apps, such as Videomaster Falcon apparently as well. I can't even boot up with an SC1224 monitor with the CT60 on and the motherboard mods, although I can boot up with the CT60 turned off. Are the motherboard mods active all the time, even with the CT60 turned off?

Since you don't have the motherboard mod, can you tell me if you can play MP3s with the CT60 alone with Aniplayer? Just curious...

Thanks.

I did hold the buttons for 10 seconds.
I was touched, I've never seen a mouse waving at me.

Ronald,
He should be able to play MP3's with Aniplayer with no problem. I know before I did the MOBO mod my CPU load was around 10 percent playing MP3's now with the MOBO mod and a 97.5 mhz CPU I am down to 5 percent CPU load. This is playing a 128 kbit/sec MP3. Really the issue is here that older software was never designed for this type of speeder card. So far with apps I have encountered everything runs perfectly and VERY FAST. To me getting the speed is far more worth it than a few older apps or demos that decide not to work.

Just my 2 cents worth.

Thanks,
Carey C.

Hey Chris,

Whats up?? Just thought I would add that Rodolphe and Didier both I am sure did some extreme testing out of the bus speeder part of the CT60. If look at Didier's web page I think he is pushing 26 or 26.5 mhz out of his bus speeding which mean that the DSP and Videl are running at 52 or 53 mhz. Sure this is probably on the high end of the spectrum for all chips involved. But I am sure your not running 100% load on any of these components all of the time that the computer is on.

Agian just my 2 cents.

Thanks,

I never tried it before doing all the serious updating to my Falcon. I seem to be getting about what you are - just a little less. At 95mhz (100 craps out - haven't tried any of the odd speeds inbetween yet), Aniplayer reports about 10 percent usage. I'm perfectly happy with that. :-)

As far as the older apps go, I've no problem with except that I would like everything to work just like a stock Falcon - once I've got the CT60 turned off, etc, etc,.. So far, its really one single app that I used to use a lot back in the late 90's, and that was Videomaster Falcon. I can't get it to work at all on my current setup. I've tried the usual (setting program flags, booting up to ST lowres with no accs/auto/cpxs going) but its made no difference.

VMF worked fine for me with my first Falcon and a Nemesis accelerator so I had high hopes that it would work (at least) with the CT60 turned off on my current Falcon. Something is different though, as far as the modified chips/speeds go.

I think its down to video modes used, IMHO when the bus is running 20/25mhz some screen modes refuse to work correctly. I know half the apps I used didn't work so just gave up in the end.

I am pretty sure aniplayer works in CT60 mode, but I have never been able to solve my CT60 problems yet, I am lucky to get even to the desktop let alone running any apps. I'm waiting for the CTCM module, going to try underclocking the CT60 to like 40mhz and see if it runs more stable then... my falcon has been in bits for like 2 years now, even sent my falcon to rodolphe for testing and he said it works fine, I dont see how as I can't even get to the desktop without it crashing... ah well, old story now... hoping I can get some boost out of the CT60 so I can at least put the lid back on my falcon!

FWIW, I can't play a mp3 in 030 mode, not very well, CPU flatlines and mp3 starts stuttering, I think in CT60 mode it uses about 50%... really can't remember now, half given up tbh.

Chris

HI Carey,

Trying to remember the things I was using at the time and really can't, was like 10 years ago when nemesis came out ?! I know I played a lot of falcon demos which didn't work, though it was even simple things like depackers which would crash... its wasn't due to it being unstable, I could run programs all day long and it would run fine... some apps would work fine and others would just totally screw up... It didnt matter if you ran 20 or 25mhz even... All I can say is, from what I remember, that some video modes wouldn't work with the bus mods, it would be like the screen lost a sync or something... programming in 25mhz was fantastic! though with all the other apps which didn't work it just wasn't worth it..

I regret I dont have a clue on what the apps were now, was all a very long time ago, but as nice as 25mhz would be, its not something I would do again.. I know a lot of people (in the past) who killed thier falcon running it at 25mhz, so for me, at least, im staying well clear of bus modes.... saying that I can't get my CT60 to work correctly either... like I said to ronald just, I am waiting for mt CTCM so I can try underclocking the CT60 to 40mhz (if It goes down that low, I think so...) I would be happy just to get my falcon put back together and get on with archiving my floppy collection... would like some boost in speed to speed the whole process up tho.. I think the only thing to do is send my falcon back to rodolphe for testing again... though really can't see the point in doing that a second time :-(

Aniplayer is strange one, if you do manage to get as far as to load it up, you could play a mp3 for like a hour or something silly (yup same one looped) then move the mouse and it would crash... gem desktop would be like that too, I used 80col 16 colours for my desktop, half the time I don't even get that far (its not the acc's or auto programs either) in fact I posted some images of the crashes a while ago on here. All I was doing was doing a total clean boot and changing video modes from like ST low to ST med, etc, just doing that would crash... so still have no idea why it won't work....

actually I have a veloce STE, I think its running a 60020 at 30mhz, might just use that :-)

Cheers,
Chris

Show Rescheduled to

December 4, 2005!

As some of you may be aware, we are allowed the use of the National Guard Armory in Lorain, Ohio because one of our committee members is a member of the National Guard. This allows us to hold this event very inexpensively and free to vendors and attendees. In order for us to hold CCAG at the National Guard Armory in Lorain, he must attend the event. Unfortunately, Hurricane Rita activated the National Guard unit that he is in which meant he was unavailable for the now previously scheduled event date of October 22, 2005.

We have rescheduled the show to December 4, 2005, and have announced it via our email mailing lists and on this website.

http://ccagshow.com/

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork.
For both computer and monitor $250.00 Plus shipping.
JPGs available upon request of the whole setup in action.

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmh@netzero.net for
more info.

Last updated 10-08-05

HARDWARE

Atari 520ST Computer System. Unit is upgraded to 1 Meg of RAM. Unit comes with mouse, power supply, floppy drive, and manuals all in the original boxes!	$50.00
Atari SC1224 Color Monitor.	$25.00
Atari SM124 Mono Monitor.	$25.00
Atari PC-1 Computer System. This is Atari's first attempt at the IBM clone market. The IBM clone is in an Atari Mega ST case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2" ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled GEM Operating system, and manuals that are photocopied. Serial Number is #0007 so besides being very rare it's one of the First! Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the box with paperwork. For both computer and monitor	$250.00
Fast Fax by Michtron. This is the original fax hardware/software for the Atari computers. Works with ST 520 to Falcon. This is a special Michtron 9600 Send/Receive Fax Modem with software. The software is very efficient, powerfull, and simple. Send, receive, view, log, and print, faxes. has drivers for popular printers and the SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone fax machine. Comes with special fax modem, diskettes, and manual.	$20.00
Syquest 44 Meg Cartridges. These will be Atari HDX formatted with no bad sectors.	$5.00
Syquest EZ-135 Cartridges. These will be IBM DOS formatted with with no bad sectors.	$5.00
Syquest EZ-230 Cartridges. These will be IBM DOS formatted with with no bad sectors.	$5.00
SC 1224 monitor cover by Classic Covers. This is a brown cover with the Fuji logo and underneath "Atari SC 1224 Color Monitor". Perfect to protect your monitor from dust and have it look cool too.	$5.00

AtariSoft IBM Games

** Note ** these games are made for the IBM PC on 5 1/4" floppy These were made in 1983 when Atari was making games for multiple computer and video game consoles. All the games bellow are BRAND NEW and never used! Games are $10.00 each.

Battlezone	*sealed*
Centipede	*sealed*
Defender	*sealed*
Dig Dug	*sealed*
Galaxian	*sealed*
Gremlins	*sealed*
Jungle Hunt	*sealed*
Moon Patrol	*sealed*
Pacman	*sealed*
Robotron 2084	opened

GAMES

Annex by D. Pritchard. An DOOM Alien shootem up game.
Docs, disk $5.00

Bridge 4.0 by Artworx. A comphrehensive contract bridge-playing
program. Box, docs, disk $5.00

Captain Blood by InfoGrames. An involved space game of exploration.
Box, docs, disks. $5.00

NightBreed by Ocean. A game based on a Clive Barker book/movie.
Box, docs, disks. $5.00

Renegade by Mastertronic. A Star Raiders type space shooter
type game. Manual and disk. $4.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Sinbad and the Throne of the Falcon by Cinemaware. Docs and disks $5.00

Transartica by Silmarils. A Falcon030 game where you are
the captain of the a Train on the frozen planet. Docs, Disks. $15.00

MISC SOFTWARE

DC Shower by Double Click Software. Replaces the TOS "Show" button
when double clicking on a file from TOS. Many different types of files
can be manipulated like graphics, compressed files, and HEX.
Docs and disk $5.00

Degas by Batteries Included. The classic graphics and drawing
program for the Atari ST platform. Comes with book and disk $5.00

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASH�s Web Site and can be in English via the free

```
RSC files also from ASH�s Web Site.
For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope.                                         $25.00
----------------------------------------------------------
Flash by Antic Software.  Complete Gem based telecomunications program.
Has VT-100, CIS, Vidtex Graphics capabilities and more.
Box, docs, and disk.                                                 $3.00
----------------------------------------------------------
Fuji Linux 3 CD-ROM set.  This a full Debian 2.2r0 installation of
GNU/Linux for the Atari Computer.  For more info go to
http://www.linux-m68k.org                                           $10.00
----------------------------------------------------------
Grammar Expert by Phil Comeau Software.  Grammar Expert provides easy
access to the rules of English grammar.  It also provides advice on
effective writing.  Docs and disk                                    $5.00
----------------------------------------------------------
Image CAT by Wiz Works.  The complete graphics cataloging system
for all Atari computers.  Print a catalog of image files that you
have on your Atari or view the images on your screen.  Docs and disk $5.00
----------------------------------------------------------
PrintMaster Plus by Unison World.  The ultimate designing program
for the ST to create banners, cards, posters, calendars and more!
Box, disks, and docs                                                 $5.00
----------------------------------------------------------
ST Control by Trio Engineering.  A BASIC like language that
is closer to using normal language to program.  Example
"Draw picture with Neochrome"  Box and disk                          $3.00
----------------------------------------------------------
Stalker 3 by Gribnif Software.  A great GEM based telecomunications
package.  The most complete telecomunications and terminal program
produced for the Atari.  Can be run as a desktop accessory which then
allows background downloading and more.  Box, docs, disk             $5.00
----------------------------------------------------------
Ultimate Virus Killer by Oregon Research.  Protect your ST and repair
progarms that were infected.  Manual and disk                        $5.00
----------------------------------------------------------

WANTED
------
MagiCMac OSX
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere

OTHER Platforms
---------------
I also have lists of software for other platforms like IBM DOS or Windows,
OS/2, Mac, BeOS, NeXT, and Amiga.  If interested please request a list.

As far as I am aware, Tony works for Cyberstrider. It might be worth
getting in contact with them http://www.cyberstrider.net/

However, Tony gave up the Atari many years ago.

Alison,

Are you after a collector's item, or merely a drive that will work
with an ST?

```
If the latter, you'd be better off with a SCSI drive and ICD link,
Link97 or similar.

David

> see czuba-tech for 32 MHz video modes problem sloving...

Is this the section you are referring to?

32MHz CLOCK for VIDEO modes ?
This clock is sent to the EXT pin of the VIDEL (pin #14). For RGB and ST-Mono modes you need a new 32 MHz clock because the origin 32 MHz clock will be now a 40 or 50 MHz. More, if you have a old NON-Multisync VGA monitor, you will have some problems to set some extended video modes with a 40 MHz and worst a 50 MHz clock. A 32 MHz clock is ideal for such old VGA monitors. Locate the video chip 'VIDEL' (U34). Locate the pin #14, counting to the left from the right back side. In front of this pin, there is a metallic hole connected to this pin. With the tip of the utility knife, scratch the varnish until you reach the metal, then tin it. Be

Careful with the videl. Solder a short cutted pin of a 33 ohms classic 1/4 W resistor (not furnished) into the right forward hole of the oscillator U37 (see DSP picture above). Solder a single thin wire from the resistor to the hole of the videl pin #14. This wire must be as short as possible and above the motherboard. For this place the wire on forward border of the floppy motherboard connector and fix it with adhesive. If you have the gray ATARI VGA adaptor, the extended video VGA modes with the 32 MHz clock on pin #14 won't be possible with this atari VGA adaptorout modifying this adaptor (which is bugged !). You need to flip it and cut with the utility knife into the plastic, a 1cm wide strip on the whole length and at 4mm of the metallic border. After this you can access the inside, you separate the pin 15 from the pins 11 and 19. Move aside the 2 wires connected to pin 15, cut them as close as possible to the pin and connected them together. If you don't want to do this hack, you can get 2 DB19 (male and female) that you will solder (direct cabling) without connecting the pin 15 (cut them). This little adaptor will be inserted between the Falcon VGA port and the gray ATARI VGA adaptor.

So are you and it saying that if you don't do this you can't do RGB with the CT60 and the motherboard mod? That would maybe explain some things, like why some software doesn't work.

Thank you.

Hi Rory,

Have just posted the following on;
http://www.atari-forum.com/viewtopic.php?p=52391#52391

Aly

"

rat tisa wrote:
Has anyone got an eiffel interface or can build one that I can buy from them?

I particularly want to be able to use a PS2 keyboard on my STe.

Ello,

You sure can buy them, here; http://fujiman.no-ip.com/

The post appeared on comp.sys.atari.sys a while back. The guys' name is Rory McMahon who purchased the bulk of remaining stock. His email addy is...
rorymcmahonNOSPAM@yahoo.com

There's a few things regarding Eiffel you need to be aware of;
*You'll need to dismantle your ST
*Once installed you then cannot use your existing keyboard or ports, Eiffel is a replacement.

I've been approached to build a few of these but would definitely point people in Rory's direction first as he's there with the thing.

Hope that helps,

Aly

Hi David,

Nope, definitely need an ACSI drive.

Not going to get very far in developing what I am any other way. ;-)

Sowwry, you're the third person to say, ooh have this or that. No, I
definitely want an ACSI drive, preferably a stock Atari.

There's hidden stuff in the way they behave which I need to find out, hence
why the STE's wouldn't work with non Atari drives. It's hidden responses in
the firmware on the host boards and I need to get a storage scope on the
thing.

<smiles>

What kind of hidden responses would that be? I cannot imagine that there
is something hidden that has not been published in Atari's ACSI/DMA
specification and is still not known untit today.

Er, I'm confused. I used an STe (TOS 1.62/2.06) with the 4 gig SCSI
Seagate drive that runs DarkForce now, for a long time. That was with the
ICD Link2 and no problems whatsoever.

Ello,

I haven't got a clue to be honest.  It's just written in one of the ST User
magazines about the long list of STE incompatabilites.  So wanted to check
```

it out.

Please, I just want an ACSI drive. :-)

Well, it's just as Ronald already mentioned: There is nothing special
with Atari's ACSI drives, and you can connect any stock SCSI drive to
the STE (with an ICD Link or LINK96/97). There are no incompatibilities.
If there were I would definitely know about them ;-).

> Please, I just want an ACSI drive. :-)

There are almost always some available on EBay.

It was included in Atari's developer documentations, but basically the
same information has also been published in third party literature years
ago.

Ello :-)

You're making me tempted to send you a long list of questions ;-) But I
thought I better not push it.

May I?

Really with this ACSI HDD I just want to iron out all possibilities in this other development. This is practically how we did PeST too, by abusing it in every way before shouting about it. Hence why I'm a bit cyptic sometimes, as saying something fantastic is about to be done then going quiet on it I hate doing. You know what I'm doing though ;-)

Ah eBay, HDDs bit pricey on there atm, and of unknown quality. eBay's been a weird these last few months, not as much good hardware on there and cowboys moving in. Last Atari metafile a few weeks back was �120 without a 19DB cable.

Aly

Is there such a tool that will force the macine to PAL? I have some games I want to run in PAL but my computer is NTSC. I am after a tool that will stay in memory if possible as the disks I have need to boot from the boot block.

Hello Chris,
Hi how is it going??? Obviously not very good if you have had your falcon down for almost 2 years. Hey I can offer my services. I have gotten 3 CT60's that have not worked or people said they would not work for them to work. So I am offering my services to you if you want them. FREE of charge just pay the S/H both ways. I enjoy working on this stuff and one friend of mine in Minnasota USA had his torn down for that long and I got him up and running in less than 30 minutes. Just ask Mark D. I was typing to him on AOL while getting my friends computer going. If you do not want to ship it. Maybe we can meet up on a video chat online or some sort of IM like ICQ, yahoo or AOL I have them all so just let me know. I almost ended up with a CT60 once for 150 dollars because the person was so fed up with it. Unfortunately for me I was able to help him. LOL. Let me know, I just really hate to see a good speeder card just collecting dust. What kind of 68060 CPU do you have?? What are you running the CPU at?? All CPX's installed in proper place?? What OS are you using?? What is your hardware setup?? STram, Fastram brand and size??

There are lots of other questions I could ask and need to ask. Every single one of these are very important. Lets get to the bottom of this so you can once agian use your falcon but maybe at 60 or 66 mhz. maybe even 72 or higher with the CTCM. E-mail me at f a l c o n 0 6 0(at)a d e l p h i a(dot)n e t

Just cram all of that together and replace the letters in parathesis with the appropriate symbols

Thanks,
--
Carey Christenson

What is supposed to happen when you hold both mouse buttons for 10
seconds?

On my CT60, the mouse pointer just seemed to jiggle a bit.
Nonetheless, one could cycle through the resolutions well enough.

Galen

I'm just guessing, but I suspect Alison is interested in making
something that attaches to the ACSI port directly.

If you're doing what I think you're doing Alison, I hope you succeed.

thanks your your offer, I am open to suggestions for sure, cant see anything
"wrong at all though" can't exactly mess up plugging the thing in ;-)

if u wanna chack u can get me on 65101852 (I think) im on ICQ all day,
also all the other too, but not aol :P

Let me know, I just really hate to see a good

CPU, erm, the full version I think... its running at 50mhz at the moment,
software does not matter, even a totally CLEAN boot fails most of the time,
fast ram is crucual 256mb CL2... maybe 128mb can't think offhand now..

> There are lots of other questions I could ask and need to ask. Every

still waiting for CTCM, wnat to try underclocking it more than anything atm.
Disabling the fast ram does appear to help but still far from perfect.

There is no such thing as an ACSI "DRIVE". There are ASCI to MFM/RLL interfaces (i.e. for non-SCSI drives) and ASCI to SCSI interfaces. Many of

the original drives went had two interfaces an ASCI <=> SCSI and then a SCSI
<=> MFM. I used to have one years ago. Can't remember who made it..
(Omnitech? I think.) I still have the ASCI <=> SCSI bit which is a BBDP
interface but it now has a small capacity SCI drive on it.

As far as I know there is NO firmware in ASCI interfcaes. Keyboards are
programable, but the ASCI interfcaes, no way. In fcat STE's don't always
work with ATARI drives never mind third party drives. I think this issue is
just a plain and simple noise/buffering/no parity problem. If mnemory serves
me correctly the drives usually work fine until things start getting a
little warm, when they start to corrupt the directory. In my case it would
run for about 20 mins, when it would start too loose data from the drive. If
this is undocumented commands/responses I'll eat my hat (genuine Panama of
course). In fact there was a suggestion some where that if you improved the
voltage regulation to the dodgy GAL it would (usually) work. I bet they
didn't design it properley, ignored the noise margins, and then just didn't
soak test the thing properly with enough machines. Atari seemed to work like
that at the time, no sense of quality...

You might also want to check out

http://atari4ever.free.fr/hardware/drives.html

and look at the diagram there. I don't suppose it will work woth modern drives that need an initiator ID from the interface, but it might be a good starting point. I checked to see if its the same as my BBDP interface and its not. The BBDP interface has 15 LS Ic's on it,

2 x LS374
2 x LS240
1 x LS138
1 x LS280
1 x LS08
1 x LS132
1 x LS09
1 x LS04
2 x LS74
1 x LS54
2 x 7404 (yes not an LS version)

So not sure how you would hide any firmware in those :-) Its dated 1990 and works on all the machines I have tried it on , including an old MEGA ST (NOT STE), and standard STE and a TT032. As I said before I did have to have the GAL swapped in the STE but Atari did this without charge (except postage). Since I had the IDE interface popped into the STE I have used it mostly on Mega with an Seagate ST157N drive in it.

Dave.

Hello Dave,

You're gonna love this, one brilliant come back in the right place at the
right time.. Perhaps..

Top side of the Mega STE ACSI host board;
http://www.retro.dial.pipex.com/acsi_ref/images/image1.jpg

Okies;

The 245A is an octal bi-directional switch (would have expected to see 2 of
those if doubling up on pins)
http://www.maplin.co.uk/Media/product_pdfs/ub67.pdf

Those two marked ACSI and SCSI are GALS, so MCUs

The 374A's are octal flip flops
http://www.maplin.co.uk/Media/product_pdfs/ae28.pdf

I'm working out how these are used as am going to need some sort of method
in what I'm trying to design, so as to cut down on main MCU I/O pin usage.

As for those hidden commands, there aren't any, it's that noisy I/O as you
mentioned, have been reading up more through the magazines as time went by.

Some of the HDD manufacturers at the time endorsed modifications to their kit involving cleaning caps etc. Well, saying that, Uwe has shed light on some (well 1, 0x1fH), which were used by the ICD/Link host interfaces to issue real SCSI commands through the ACSI port. The default ACSI addressable sector count is 2^21 * 512 bytes / 1Gb, these commands allowed this to be exceeded. Another mention has been made by ijor on another group that you can switch to 1024 byte sectors etc.

<smiles> and thanks,

Aly

ps. It's a FUJI Finepix S7000 btw..

It draws a box after 10-seconds and enters it's setup mode, where the left mouse button cycles through the resolutions. It draws... right 100 pulses to indicate mode 1, right then left = mode 2. right, left, right = mode 3. right, left, right, left = mode 4. Pressing both buttons again draws the box again, the one you saw when entering setup.

>just seemed to jiggle a bit.

Really???

@CHRIS@ You have a CT60 board??   ;-)

Hey Galen, is this causing you problems? You're getting on fine yes? Please do let us know on this?

I'm sitting here just wondering what the CT60 would do to the keyboard MCU, not alot I think. I think it's clock is internally generated and it communicates with the main motherboard at a set baud rate.

I will try with with CT60, though as you can see from other threads its rare for me to even get to the desktop with CT60 ON... some of the hacks overclock the KB MCU, though ive not tried any of these hacks for a long time (one of my pet hates actually). The keyboard timeings will be faster if the MCU is overclocked, though I wouldn't expect it to effect pest in anyway. Would help if Galen said if he did MB mods or not.

Alison, mines on the way - as soon as it gets here I'll try it with my
CT60 equipped Falcon. I do have the motherboard mod as well (somebody
asked in another message in this thread).

I'm laways issapointed to read such bad things !
If you sent me your mb + CT and I told you that it was running fine at me,
you can be sure it was running fine...
NOW, you should think what are the peripherals you do not sent me ?
Because there is a big chance that one of these (the HDD and the software on
it !) is the problem !

When I receive mb + CT to test, I connect them on MY PSU and my HDD that
contains a good version of HD Driver (7.60).
My HDD is a Quantum Fireball 3.2 GB.

Even if you do not boost the mb, you can get some HDD problem because of a
HDD timing problem himself or a software driver problem !!
Think to that : HD Driver may run fine on 100% of HDD models on a 030 CPU
and run on 95% of the HDD models with a so faster CPU like 060.
It is a timing problem (software timing, not hardware because MFP is the
same !).

VIDEL is receiving 3 clocks !
25 MHz fixed OSC for VGA modes
32 MHz bus mb clock for RGB/ST MONO modes.
EXT clock.

When you do not boost the MB, you don"y need to change something !
When you boost up to 16 MHz the mb, your 32 MHz clock will change. SURE, you replace the 32 MHz mb clock by a 40 or 50, so you get a 40 or 50 MHz on the VIDEL, so 32 becomes 40 or 50 ! So, the RGB & ST MONO modes cannot works because V & H sync have shifted !
It is WHY is an obligation to RE-inject a 32 MHz clock on the EXT clock input AND select the EXT clock input as the clock reference for RGB & ST MONO modes ! This selection is done by software (just a bit) and the CT60 BIOS test this at boot !

The only other item is the HD, I use HD8, though like I said before, even if
I unplug EVERYTHING and just change video modes in GEM a lot of the time it
crashes also. This is just why I think very odd that I send you exactly what
I am using and you say its fine but when I try it I get nothing but
problems, the only thing which seems to help is to disable SDRAM, works much
better but still lots of problems... there must be something stupid
somewhere which is causing the problems.... but what.... I do not know....

i'm not saying CT60 or your work is bad, I think CT60 is a fantastic bit of
kit. I wouldn't be trying to get it working if I thought it did not work!

Note that the mechanism introduced by ICD (also also used with the LINK96/97) is not only relevant for addressing drives with a capacity of more than 1 GB. Since *any* SCSI command can be sent this way it is also useful (and even required in some cases) for other things.
HDDRIVER and other software using the SCSIDRV interface make heavy use of being able to send any SCSI command on the ACSI bus.

I doubt that there is any switch for 1024 bytes per sector. What would this switch be supposed to do? Any change in the sector size is useless without software that can handle this. As far as hard disk drives are concerned there are only a few that support other physical sector sizes than 512 bytes.

PeST works fine on my CT60 Falcon, note I have not done the bus mods so can't comment, though I really doubt the bus mods will have any effect whatsoever on PeST's operation. If that were true a normal ST mouse would have problems aswell.

Let us know if you've succeeded to get in contact with Thomas. In the
past I've tried numerous times to get in touchs with Thomas but sofar
without any luck.

I really would like to get a copy of Thing 1.29. I even wouldn't mind
to pay for it.

Well, both the adresses I tried bounced back, once more. :-(
I feel perplexed, as I first tried with the one in the help file, and
now with the ones I found browsing the net, the same happens :-(
Could someone tell me what the actual current one is ?
Thanks,

Jean-Luc

> FIRST PLACE!!!!!

Hey loser, listen closely.

If I set up an auction, I can decide not to have a "reserve". This saves me some money, as adding a reserve costs me a little more to list.

So I list with no reserve. However, I'd quite like to get about �100 for this item. With one hour to go, the bidding is at �50 and has been static for a while. I'm not going to get what I had hoped for this item.

So I cancel the auction.

This is exactly what would happen if I *had* set a reserve, but because I did not set one then Ebay loses out on that small amount of extra cash they would have charged me. This way, I get an auction that works the same way as a reserve, but without paying.

Ebay doesn't like that, so it's against the rules.

Oh, I forgot to add five exclamation marks, but I think you get the point.

D.

Hellow to all,

I've just listed some Falcon pieces and parts on ebay.

Thanks

I do believe he's saying your clueless.  And I tend to agree.  Payton's
correct in his reading of the policy.

You argued your own point, so clearly you don't understand the whole concept of this at all. He didn't pay the reserve fee, so he IS "avoiding" it. You pay an extra reserve fee when you list your item, so it's a little more expensive to do so. If you end your auction early because you don't like what it's selling for (which is a selling offense you can be reported for) then you just created a situation that has the same outcome as the reserve auction, BUT YOU DIDN'T PAY THE FEE!

Pete

YOU don't get it. You have to end outside of a 12 hour limit.
There is no ending any auction within this 12 hour time-frame.
Read the whole thing, not just the part you want to argue with
me about.

Bill Garber

Yes I agree 100% this guy is playing around a bit with the rules and
he admits he doesnt even know what stuff works and what doesnt, it's
probably mostly in pretty poor shape, and even if you won the auction
would you trust this guy not to take the best stuff out before you
came to pick it up?   I know I wouldnt.

I dont think he is gonna have much luck.

Haha.  Read this again, slowly.  You should stop, Bill.  You're not only
showing that you don't understand eBay rules, you're starting to look like
an idiot, too.

The last 12 hours has NOTHING to do with this discussion. You can't end
an auction for the reason this whole thread is about, last 12 hours or not.

Again, from their Policies:

"Note: Sellers are not permitted to cancel bids and end listings early
in order to avoid selling an item that did not meet the desired sale
price. This is considered to be reserve fee circumvention. Although
there are legitimate reasons for ending a listing early, abuse of this
option will be investigated."

I mean, damn. What is your eBay user id?

The fact is that one of the options is "The item is no longer for sale".
This is broad enough to cover 'because the seller fears they will not
get what they wanted for it'.
A seller can decide to not sell their item FOR ANY REASON. Therefore, if
they decide the item is no longer for sale because they fear it will not
fetch an amount they want, then that is their right (as long as it's not
12hrs before the end).

MrBiggles <mrbiggles909@yahoo.com>:

>The fact is that one of the options is "The item is no longer for sale".
>This is broad enough to cover 'because the seller fears they will not
>get what they wanted for it'.
>A seller can decide to not sell their item FOR ANY REASON. Therefore, if
>they decide the item is no longer for sale because they fear it will not
>fetch an amount they want, then that is their right (as long as it's not
>12hrs before the end).

That particular reason is expressly forbidden by the eBay policy. I also think that its highly dishonest, no matter what kind of auction you are running.

Personally, I would never do it.

Perhaps it's better, if you are contemplating ending an auction early for dishonest reasons such as not getting enough money for the items, that you don't post about it on public newsgroups first.

```

What about if your dog pisses on the item after it's listed? How about if you legitimately lose the item (some people are really that disorganized).

Thanks. And I know I'm right, and I believe they are mostly not
sellers, but buyers who have been screwed over by this very policy
and simply don't like it.  :o)

You don't know what you're talking about. At Pete posted earlier, ebay's policies specifically forbid ending an auction early because it isn't reaching the price expected. That's why they have reserve pricing.

Whether you can lie and end the auction for some other, bogus reason is beside the point. Please tell us your ebay id so we can all never buy anything from you.

```

Don't buy anything from any of these crooks. Bill post your ebay ID so we know who to avoid.

My philosophy on Ebay is that I love getting good deals, and if someone gets a good deal from me, I love giving good deals, too.

I have gotten some REAL great deals off Ebay, no doubt about it, and I was really happy about it. And I know that when someone gets a good deal from me that it is really making thier day, and that makes me kinda happy as well to be able to provide that experience to someone.

Somebody who is only concerned with what they can get out of the deal and not concerned at all about the time and effort of thier customers is not someone I want to deal with: there are plenty of ebay sellers who follow through no matter what - it is the sellers who need customers, NOT the other way around. I'd have more respect for these guys if they'd just decide how much they want and put a "buy it now" up on it, or put in in an ebay store.

```

I did - that's why I decided you would benefit from being corrected. Arguing with you doesn't come into it - others are doing that, and making a far bigger fool of you than I would be inclined to.

Is your opinion of yourself so great that you feel the need to call everyone who disagrees with you "losers"? And when someone responds in kind, then the rules change for them but not for you?

Very poor.

D.

I have to agree with Dr. Smith here, (believe it or not), but he's dead
on (IMHO).

If you want $X.XX for it, than set a reserve. If you simply end it
early because you aren't happy with the price, then you are dishonest
and should be avoided.

If anybody has an internal ST floppy drive for a reasonable price
($25-$35 or so) please let me know. I have had bad luck finding them on
Ebay (last one arrived in the mail this week- non functioning) and I
have not been able to use either of my STs for 2 months.

Thanks.

Especially if, y'know, a few newsgroup posts ended up being submitted
as evidence.  This whole thread has pretty much guaranteed that the
seller can't even put up a legal defense.

It's against the rules... Period... It's fraud. The principle of the auction system is the gamble. The seller makes a gamble on the final price. That's the fun of it. That's WHY ebay is popular!!! And it's CLEARLY against their rules. You can end an auction early because your dog pissed on the item or because you shot at it with a 9mm in a drunken fit of rage... not because you don't like the way the $$$ are going.

Give it up...

Mark

I notice a lot of people don't like Reserve auctions.... I seen pinball machines end at $150 with Reserve that you know are worth $600+ people just kinda blow them off. I certainly would be scared starting at $9.99 though (laughs).

I always start my auctions with bottom line of what I would like to get at least what I paid for it.

And always try to be reasonable on shipping too... and I 'clean' everything!

The 'biggest' thing though is I take the time to take photos and be honest with condition... that dude could make a killing if he took a couple weeks off work and sorted through everything, clean it up and test it all.

Hmm let's see... make $200 on it (he will end it early for sure) or make $2000 on it by putting some effort into it.

I dunno I kinda like making money (shrugs)

As soon as I get the shelves painted and clear coat on them. I will put some photos up. It has been a lot of work hiding the wires for everything and getting the shelves right (I suck at building things). It's like a chromosome mix up before I was born. I can't build things and work on cars.

> anything from you.

Oh ok sure... oh, wait... maybe not.

One of the legitimate reasons for ending an auction is "The item is no longer for sale". The reason it is no longer for sale can be anything, INCLUDING the possibility that it may not reach the seller's desired target sale price. If I wanted to I could end an auction early because I stubbed my toe, or wasted time explaining something to a dufus on usenet. That is the key here... a seller can decide that an item is no longer for sale FOR ANY REASON (as long as it's not in the last 12 hr window).

not necessarily, you dont know the condition of the computers (Im guessing they arent in the best shape judging by how they are stored) by his own admission he's never tried most (if not all) of them, so many of t hem are prob just garbage and virtually worthless.   Also it sound's like if you get a good deal he will prob take the best ones and keep them for himself (or sell/donate them elsewhere) and leave you with the junk.

It's definetly a gamble bidding on this auction.

> FIRST PLACE!!!!!

As others have noted, It's called a "Reserve Fee Avoidance" violation because the seller did not set a reserve (and thus did not pay the extra fee), but ended up treating the auction like a reserve auction. I see where it can be misunderstood to only apply if he was running a reserve auction, but it applies to non-reserve auctions. There is no need to end an auction early for reserve auctions, because either the price is met, or it is not. (Well, there is, if you state you are listing the item locally, and it sells before the uaction ends, but you wouldn't end the auction because you did not get the price you wanted, because that's the definition of a reserve price)

> YOU don't get it. You have to end outside of a 12 hour limit.
> There is no ending any auction within this 12 hour time-frame.
> Read the whole thing, not just the part you want to argue with
> me about.

I read the whole thing....

Actually, you CAN end the auction within the 12 hour mark. You can technically end the auction 1 second before the deadline. You just can't do it chronically.

Nonetheless, there is a huge difference between what eBay rules allow and being a good seller.

The seller has already note that if he does not get a "fair" price for the non-reserve auction, he will end it early. Technically, eBay will let him do it, unless someone complains to them about the auction.

I see a problem with the rules in this area, as the first mention of the rule states it can never be done, but right below, it gives the seller 11 times to do without incurring any investigation. It's hard to know which is correct. In any case, given how popular eBay is and the fact I see infractions committed on listings all the time, I'd say the seller will have no issues from eBay.

That said, I think the seller is acting in bad faith. Regardless of the rules of eBay, no one wants to bid on a non-reserve auction, only to see it cancelled at the last minute.

Do you believe the seller is acting in good faith by noting he will yank the auction if he doesn't get a certain amount? It seems strange to so actively defend the original sellers abuse of the eBay rules, as they are written.

Jim

Hi,

Looking for the top part of a Falcon case. Anyone
got a spare for sale? I have the rest of the Falcon
but for some reason the top was discarded.

Thanks

Rob.

hello ken ,i live in london ontario, how far am i from you?

any takers yet?
interested in books, hard drive,maybe even st.... if this guy ever gets back to me regarding a disk drive to replace..

well keep in touch and maybe price estimate ....what were your main applications for this?

charles.copp@sympatico.ca

Okay, forgot to give you all a list of the parts: here you go:

Falcon PSU   (clean, excellent working condition)
Falcon Keyboard (clean, excellent working condition)
Atari Mouse (new condition, never used)
All the shielding from the Falcon's case(plus the speaker :-))

Thanks everybody

Please note that I said : HOME computer...no consoles, no "professional"
machines...only home computers from the 70's and 80's (and early 90's) and
then I think it's one of the largest ones (also note that I placed a
questionmark after the word "world")

Cheers,
Dimitri

Theres no such thing as a Mintnet partition.
But there is a way to format a MiNT partition, if that is what you're asking.

Coda.

Well, maybe. The EasyMiNT distribution includes a MKFS.TTP program, which
will write a ext2 file system. If that is what you want, there is a way,
it will not be recognized by TOS, and I know nothing about Magic.

One can run MiNT without starting MiNTnet, and have a TOS desktop and
access to a ext2 partition. Is that what you had in mind.

Jim

Hello,

I read on here a while back that people were searching for this site. I'm doing a bit of mass information gathering at the moment and guess what I found...

<http://www.chebucto.ns.ca/Technology/NSACUG/info/faq/atariquickfaq.txt>

Not sure if it's up to date but it's in pure text which is good. If the link doesn't come out properly in Outlook go here and click on number 30.

I had found a couple of those, although not that particular site. I also
think I was the one that you're probably talking about, looking for them.

Thats a very good link though, lots of useful stuff in one place. Thanks
Techie-Alison! :-)

Guys, is there a way to set the background color of the text under icons
in Thing to the same color as the window background that its in? That
white box is sorta on the ugly side...

Thanks.

Hi Odd! Thanks for replying. Well, is that one rumor about the author
re-starting development work on Thing true? Perhaps Thomas can be offered
a suggestion about being able to change that background around the icon
text?

 :-)

Duh! <slapping self on head *hard*>

I took it as the "/" being enclosed in the parentheses, not the
parentheses being separated into right and left by the "/". Talk about not
being able to see the forest for the trees! :-)

Thanks Paolo! Gonna go try it out right now.

I am trying to resurect this Atari 1040ST I have. It worked but the video was really bad on a cold boot. Screen flipped and was unusable for about 10 minutes, then as it warmed up it got better but still was a bad video signal. I tried to get it working by reseating all chips etc and no go. I swapped all socketted chips and no go. I though, well I will just get another cheap system board! I did and both exibited a similar problem. On disk loading, each track load, or click from drive, would flip or jump the screen, but it was clear and crisp unlike original board. Also as unit warmed up from cold boot it would get less evident but still on disk loads the screen would flip or jump slightly. One thing I noticed is the drive standoffs were glued on the motherboard since the replacement boards did not have them on. The brass one was also glued on, does this need to be grounded to the board? ie no glue! I cannot see what the problem might be, I tried two different PS's.

Thanks

I remember a Rumor regarding the VideoMaster Falcon Cartridge and
Software.

The Rumor was that a version was made that would Capture real Color
Video!

Now I don't know if it was a difference in the cartridge or software or
both.

But since the software does allow you to import Color pictures into the
Video,
save it and play it back.

It would seem that the current software does support color video.

If only the Cartridge would Capture Real Color Video or the software
would
allow it.

I wonder if the software was tweaked by someone who knows what there
doing
if one could get the cartridge as is to capture real color video?

It would be great to capture 256color video with the VMF Cartridge along
with the Sound as the cart does grab the sound along with the video
already.

Does anyone remember a Rumor similar to this regarding the
VideoMaster Falcon Cartridge?

Check power supply voltages, look for bulged or leaking capacitors, replace same. Maybe two similar power supplies.

If there was any distortion, I would suggest changing C109 thru C113 from 470pf to 22pf. Some monitor cable capacitances are too high for the board capacitances, and those two working together create screen distortion.

These caps are on the RGB and sync outputs. No, the supports for the disk drive do not have to be grounded. They are just spacers.

TJ <tjlazer@crapmail.com> writes:

: I am trying to resurect this Atari 1040ST I have. It worked but the video
: was really bad on a cold boot. Screen flipped and was unusable for about 10
: minutes, then as it warmed up it got better but still was a bad video
: signal. I tried to get it working by reseating all chips etc and no go. I
: swapped all socketted chips and no go. I though, well I will just get
: another cheap system board! I did and both exibited a similar problem. On
: disk loading, each track load, or click from drive, would flip or jump the
: screen, but it was clear and crisp unlike original board. Also as unit
: warmed up from cold boot it would get less evident but still on disk loads
: the screen would flip or jump slightly. One thing I noticed is the drive
: standoffs were glued on the motherboard since the replacement boards did not
: have them on. The brass one was also glued on, does this need to be
: grounded to the board? ie no glue! I cannot see what the problem might be,
: I tried two different PS's.

: Thanks

You gotta be pretty lazy to auction off your entire collection with just
one photograph taken from a distance. You can't even see anything except
for ~ 5 pieces of equipment.
At least take a few pics from inside the locker. The guy obviously
doesn't care about getting market value for his items, as this auction
raises a big ol' red flag.
My prediction of final selling price: $112

Anyone else wanna make a guess?

I agree with the other posters, your brother needs more pictures to
back up the descriptions, also pics of the misc cables, books and
stuff.

(I'm glad my storage isn't that piled up... Though it is getting
there...)

Larry

This is my collection. I would be willing to bet that none of you have ever had to acquire, store, pay for, protect and maintain a collection this large for five years. Looking at the picture do you believe that I have instant access to prime pieces to photograph them? Don't you already know what they all look like anyway? Do you think I am lying? Anybody can get pictures from somewhere else and claim that they are their machines. If I was to post a couple of pictures of Macintoshes and cables and would you feel better? I can't take pictures inside the locker because I can't get into the locker. It's too full! And it doesn't make sense for me to start ripping packages open (as you would know if you read the whole eBay description) because as they sit now they are protected. It is just not feasible (due to the fact the stuff stacked almost ten feet high ten feet deep, the primary purpose of the photograph which is also explained in the description) to start tearing the place apart looking for a needle in a haystack. As the description says I am not selling anything super rare. If you know anything at all about vintage computers you should be very familiar with what I have listed and shouldn't need to see a picture, if you do there is plenty of that kind of stuff on the Internet. If you want to come see it in person by all means I will show it to you. I am protecting these computers as best I can. As the collection grew I was forced to rent a storage locker, as I was not considering selling the collection I did not take into account that I should pack it in any other manner other than the most space efficient and protective. Considering the circumstances this is the best I can do. It's easy to be critical. If you have the practical experience and you could do better by all means let me know.

S :-)

The problem is, we have to take your word for it. What I see in the picture is a big pile of boxes and plastic bags. I see in Apple II wedged in next to the bicycle, and I think I can see two Apple II era monitors. We all know what it takes to store such items, but when it comes to buying something we need some assurances. This is clearly a huge pile of stuff, but I see nothing in the picture I want to own. Furthermore, you make no assurances regarding physical condition, or if any of it actually works. You even admit in the description that you don't know everything that you have stuffed in there.

You probably will not get a bid anywhere near the market value of all this stuff, because your buyers cannot get a clear idea of what you have for sale. Besides, if you really want to get top dollar for this, break it up into bundles. Hell, you could probably get enough for the Apple II and the two monitors (assuming they work and you clean them up real nice) by themselves to pay for another month's rent on the storage unit, which would in turn allow you to dig into the first layer of boxes and put together a few more bundles. It's a huge job, but I think you'd be happy with the extra cash. That is, unless everything is in such bad condition (or simply non-working) that such close scrutiny by your bidders would be counter productive.

Dude, most of us here are just trying to be helpful, sure it's critisim
but no one here (except for one poster) thinks your auction is bogus.
Just that we could see you could do better if you had a better
presentation is all.

I wish you luck on the auction, certainly it's a lot of cool stuff you
have listed.

Sure I know what most of the items you list in your auction look like, but without pictures how can I know what condition they are in?   I would pay alot for mint condition Atari 800xl's and Apple II's but hardly anything if they are in poor condition.

Surely bidders are going to consider the "Sight Unseen" factor,
and the "work involved" factor as well, but, the "what-if" part
is intriguing, even to me, but I'm in PA so this is out of the
question for me entirely anyway. Had I been in the local area and
possess the space to store this stuff, I'd consider bidding and
should the list even remotely describe what "is" there, it truly
could be the Gold Mine that is being offered. The person who is
auctioning off this stuff, however, is inveritibly, "The Loser".
Broken down and sold in separate lots surely would bring loads
of cash, but this way, it is just a garage sale at best.  :o)

As a collector (of a quite a large amount of vintage computers and game systems) I think its 'BLASPHEMY' to treat your collection like this and just stack and pile it to the ceiling with no rhyme or reason!

One has no respect at all if they treat their prized collection like this.

Still would be cool to go through... feel sorry for whats on the bottom though (sigh)

I wish I had that much money where I could just not care and sell everything in one huge pile on eBay. People don't realise if took the type and tested and took photos of everything that one could make a killing on eBay instead of a bulk deal for stuff.

I will cherish that photo though thats funny but sad give the collection to me... I will air it out and add it my 'shrine' of gaming.

VastFear

I was a compulsive hoarder, I bought most everything I came into contact with thinking it was going to be valuable/needed/useful someday. I (foolishly) envisioned that I could save this stuff until I retired and then it would be the basis for a hobby. I rarely if ever tested what I bought; I figured I would do that as my hobby. If something didn't work I would (and do) have multiple examples from which I could get parts. I assume most of the stuff I bought worked; I have no reason to believe it doesn't. I assume some of the stuff has problems. The collection is obviously being sold as is, like I said if something doesn't work there is a good chance there is another example that does. There is a reason I am selling it the way I am, I do not have the time or the resources to break the collection down and sell it bit by bit over eBay - THERE IS TOO MUCH! If I don't get a reasonable offer I will donate the majority for a tax write-off and keep only the cream of the crop. A lot of people seem to be taking this personally. Don't, it doesn't involve you. This auction is not for everyone. It takes a large commitment (I pay $100 dollars a month to store it) and most people will not be in a position to handle it. As far as having to take my word for it, I imagine you've noticed that's how eBay works; a lot of it is on faith. Once again (If you read the full description) you'll notice I referenced my feedback (much of it gained from buying stuff in the collection), it is impeccable. Tomorrow I will go out there and rip some packages open and take some pictures, I don't think this is really going to give much insight into the vast majority of the collection, but it's what the

people want. Please know that I do appreciate the constructive
criticism, it's the ignorant blowhards I could do without.

S:-)

Um, does this mean you plan to renig on your auction if you don't like the
final price? You did not set a reserve.

You listed with no reserve and you have a bid - you don't get to keep or donate anything.

>..... my feedback (much of it gained from buying stuff in the collection), it is
> impeccable.

won't be for long if you reneg on your auction.

Oh so now you will decide depending on the winning bid what the person
gets? This doesnt sound right at all.   Personally I would stay away
from your auction.

I am not legally obligated to give away for next to nothing something I
have thousands of dollars and years of effort sunk into. If I was to
end my auction early (emphasis on my, it's meant to serve my purposes,
I'm the paying customer), I would be well within eBays rules

(http://pages.ebay.com/help/sell/policies.html). They are only concerned with "Chronically" ending items early. If I were to do it, it would be the first time ever. S:-)

This is directly from eBay seller policies.

Ending Your Listing Early

Sometimes something goes wrong and you can't complete your listing as planned. If needed, you can choose to end your listing before the scheduled date. If there are bids on your item, you can cancel them.

Reasons for ending listings early include:
Note: Your account will still be charged listing fees (such as the Insertion Fee) if you end your listing early. Consider revising your listing first if there are aspects of it you want to change or improve.

a.. The item is no longer available for sale.
b.. There was an error in the starting price or reserve amount.
c.. There was an error in the listing.
d.. The item was lost or broken.

Timing Matters

When there are 12 hours or fewer remaining and the item has a winning bid, including a reserve met bid, sellers may not make any changes to the listing, including:
a.. ending the item early. Sellers may cancel bids, but not end the item unless the item is being sold to the high bidder
b.. adding to or changing the item description
c.. converting the item to pre-approved bidder

Canceling bids or making changes to a listing with bids when there are 12 hours or fewer remaining damages the buyer experience and can undermine trust in the marketplace.

To end your listing early, follow these steps:

1.. Type your item number into the End My Listing Early form. (You can get this number on your listing, on your confirmation email, or on your My eBay page.)
2.. If there are bids on your item, choose between:
    a. Cancel bids and end listing early
  or
    b. Sell item to high bidder(s) and end listing early
  If your item has no bids, you'll skip this step.
3.. Choose the reason you're ending your listing early.
4.. Now your listing will end and will no longer be displayed on eBay. If there were bidders, they will be emailed that their bid was canceled and the listing ended early.

Note: Sellers are not permitted to cancel bids and end listings early in order to avoid selling an item that did not meet the desired sale price. This is considered to be reserve fee circumvention. Although there are legitimate reasons for ending a listing early, abuse of this option will be investigated.

Bill Garber

Not according to what you posted:

/Note: Sellers are not permitted to cancel bids and end listings early in
order to avoid selling an item that did not meet the desired sale price.
This is considered to be reserve fee circumvention. Although there are
legitimate reasons for ending a listing early, abuse of this option will be
investigated./

That means that since the seller indicated in this thread that they
intend to end the auction early if they do not receive a "worthy" bid,
which implicitly is a circumvention of the reserve fee, thus an abuse of
```

```
the end-early option.

Actually, if you don't set a Reserve Price and you don't end the auction
early, you ARE legally obligated
to sell to the highest bidder. Just as making a bid constitutes a contract,
so does offering an item for sale.
If I were you, I'd end the auction early and re-list with a Reserve Price.
As it stands, if the winner of the current auction wanted to take the case
to court, you'd be on very shaky legal ground.

Does anyone know if it's possible o run a flatscsreen (LCD) monitor in
interlaced mode? (My own guess is no...)

I'm trying to find a way to drive a 19" 1280*1024 monitor in monochrome
with a Crazy Dots card on a TT but I think I would need a too high
dotfrequncy to get the desired resolution in non interlaced mode?

Which is the latest working VMG-4000.PRG ?

I have tried the 1.12 version from:

http://www.ping.be/~pin10575/CRAZYD-E.HTM

but it does not seem to work with neither the Crazy Dots or another

Spektrum I card. When testing an existing good resolution the monitor
goes out of sync. If I try the older 1.8 (supplied with NVDI5) everything
is fine.

The HISTORY.TXT in v. 1.12 reads:

V1.12
Spezielle Mega4000 Version IO16,W32 only. :-/

Maybe that's the reason it doesn't work on my setup?

On:

http://www.wrsonline.de/backscan.html

VMG-4000 1.15 is said to be the latest version! Any source for that
version? Maybe the author Andreas Winter still can be reached somehow?

Read, it says "DESIRED SALE PRICE" and "RESERVE FEE CIRCUMVENTION".
This applies to auctions with a reserve fee set. He has none set.

> That means that since the seller indicated in this thread that they intend
> to end the auction early if they do not receive a "worthy" bid, which
> implicitly is a circumvention of the reserve fee, thus an abuse of the
> end-early option.

Here you eat your own words, where you repeat the same terms,
"CIRCUMVENTION", and "RESERVE FEE".

He may end his auction at any time before the 12 hour to end limit.
You pulled your data out of context, and I've been a seller on eBay
for quite a while, so read up.

Bill Garber

Hi there,

I am selling my complete collection of computers (over 570 different =
ones).
If you are interested in some computer(s) from my collection, just mail =
me
at info AT fki DOT be (replace AT by @ and DOT by .) and I'll add you to
 the list of possible buyers.DO NOT MAIL ME BY RESPONDING TO THIS =
MESSAGE
PLEASE!

 In max. 2 weeks time I will start a mailing list and everyone will be =
able
to bid on SEPARATE computers.The exact procedure of the sale will then =
also
be explained

So...please don't mail me saying : I am interested in X and I want to =
know
how much you want for it as I don't have prices set.

As you can see from my 100% positive feedback on Ebay (member ChaosDM)
this is not a scam, but a serious sale. I don't want to go through Ebay
directly, because listing 570 different items
separately would take AGES!

Anyway...the list of the collection can be seen here :
http://users.pandora.be/F-242/Computers.htm

There are a LOT of very and ULTRA rare items in there

For example :

A GOLDEN C64 WITH COMMEMORATIVE PLAQUE!
A LOT OF ARABIC MSx's
A LOT OF RUSSIAN COMPUTERS
ETC...

Cheers,
Dimitri Kokken
Belgium

I too have been a seller on eBay for quite a while, and I feel my
interpretation is correct. The term "reserve fee circumvention" means
he did not use a reserve, thus circumventing the reserve fee that eBay
charges. The policy stated is their to protect eBay's fee structure,
not the seller nor the buyer.

Please read ALL of the policies on ending early, not just
the areas you need to argue with me. It says, should the
seller end early, the eBay listing fees will still apply.

'Nuff said, say n'more, nudge-nudge, know what I mean?

End of discussion, because I know what I'm talking about.

I'm intrigued as well and in Philadelphia. Maybe we should make a drive?
I definitely do NOT have the space right now, but I plan to buy a house
within a year which will have a suitable basement for this pile ;) I
worry about renting a truck and getting there and it just being completely
worthless junk. I think we all know some collections are like magic,
others are a pile of half broken 520ST's. I'd pay more for a single
clean falcon than 15 dirty 520's. That's why the contents matters to me,
and while this is intriguing enough to look at, I won't make the drive on
that description alone.

Thanks,
Mark

Doh!

Nevermind, the collection is in Portland. I thought Massachusetts for some reason. My ownership of this collection is now completely out of the question ;)

Thanks,
Mark

This is the correct interpretation- if you end your auction early by cancelling all the bids and ending it, you essentially created a reserve auction without paying for it. That is what eBay doesn't want because it damages the marketplace. Nobody will bid on things if they knew the carpet will just be pulled out if it looks like they are going to get a good deal.

If you want more money for your good, then set the reserve, or else just set the minimum bid amount for the least amount you would take for it.
  If you put it up for a dollar and later pull the auction, you are a jerk and I would report you if you did it.

Ebay has a lot of screwed up rules that they continue to use that make no sense, and really this is still actually too easy to do- you should not be able to end your auction *at all* in my opinion.

Pete

No, you don't because he didn't pay the reserve fee.

I'm not arguing with you. It says you can end any auction
outside the 12 hour limit, by choosing one of 4 options
for doing so, but you still pay the listing fees for the
auction type you chose. Difference is with a reserve price,
if it ends naturally you can still choose NOT to sell to
any of the bidders. Now go away. Thank you.

Bill Garber

What was discussed here is clearly mentioned in the rules as "Reserve
Fee Circumvention" and is a reason to report the seller.  I don't
understand how it could be more clear.

http://pages.ebay.com/help/policies/listing-circumventing.html

It actually calls it "Reserve Fee Avoidance", not Circumvention, but
same thing.

-snip-

Reserve Fee Avoidance - Canceling bids and ending a listing early
because the seller's desired price has not been met.

-snip-

Hi,

I sell by auction my Atari Falcon on german ebay:

<http://cgi.ebay.de/ws/eBayISAPI.dll?ViewItem&item=8709379926>

more informations and pictures here:
<http://www.maedicke.de/falcon/falcon.htm>

Sorry, it's all german.
You can write me an mail if you have a question.

Ciao, Bernd

LLLLLLLLLLLLLosers!!!!!. Listen closely. HE DOES NOT HAVE A
RESERVE PRICE SET, SO, HOW CAN HE AVOID A RESERVE FEE IN THE
FIRST PLACE!!!!!

Hello all
I will be recasing my Falcon soon as well and was wondering about the
floppy cable myself..Is the floppy cable thats in the Falcon fixed to
the motherboard? I was going to remove it but didn't want to rip it out
(I think i saw in a post someone did that) do i need to get a header
(the pins) installed? and if so who/where can i get that done for a
reasonable price (NO WAY am i going to attempt it) Thanks in advance :)
Thomas

Yes, I have - in fact thats the only way they will work. If you plug them
in the other way, the access light on the floppy drive never goes off.

> ISTR that for some reason there is a

Yes. 34 pin standard.

Thanks for replying.

Hi Thomas. Yep, its attached, and its not a PC standard header. You can
either find a cable that will extend the current Atari one, or replace the
header with a standard one as has been mentioned.

> that it would help me figure it out:).

Er, no - it plugs into the cartridge port and nowhere else. It doesn't use
the joystick ports at all.

I don't know if I can run TT Digger or not. I don't even have it, never
used it before. :-(

Ok thanks for the info..
Guess I need to holler at Best since if I was to want the header put in
no one around here could/would do it (in Knoxville TN) I only hope my
CT60 experence goes well but no idea how i will upgrade the cmos (was
hoping to get the USB/ethernet card from Nature) but will cross that
bridge when i get to it :)
Thanks again
Thomas

Thomas,

I can install the header if needed. I live in Illinois and would have a quick turnaround. If you are installing the CT6x then I can update the required parts.

Rory

There are 2 pots for Contrast and Brightness and a small adjustment for
Scan Width.

The 2 Vidi ST carts I have will capture Color. If you use VideoChrome
and etc, you get more
options for Color Grabs, IIRC.

I have one Splitter for a Vidi ST Cart.  Its a nice splitter, and has
some built in features
that one might could use for sometype of video project.  It looks more
professional
```

than the VideoMaster Splitter, even though the Videomaster cart is
actually better than
Vidi ST.

However, I think you can use either splitter with either cartridge.
That's something I will explore more on in the future.

(Have a Ton of Projects at the Moment)

I have even used a Videomaster splitter with a Expose' Main Board
Digitser on the
Falcon.

I also have the Vidi ST 12 Cart that has the built in Splitter and does
4096 Colors.
It is a 12 Bit Cartridge.
It works on a ST/STe or Falcon and does much better Color Grabs/Video
than the
older Vidi ST.

I was just wondering if the older Vidi ST cartridges had any known PCB
board upgrades?

The 2 Vidi ST carts I have are both black, but the size and shape are
different, but the
basic software that came with them are about the same version. One is
1.29 and the
other is 1.29B according to the original disk labels.

I have noticed differences in PCB design in VideoMaster Falcon Carts.
But only after
taking off the cover. The Carts themselves all look the same.

Looking for version 1.01 of the Universal Network software.

I have version 1.00 and manual and Midi Kits.

Would like to know whats different in version 1.01 and if the
software went beyond v.1.01.

I've got Videomaster Falcon.

I've just finished playing around with it for awhile. I tried it with the CT60 on/off, motherboard mod on/off, under MINT, under TOS, booting up from the hard drive with all AUTO folder programs, ACCs, and CPXs disabled, and with fastload on/off, TT ram on/off, and TT prg on/off.

I also unplugged the DEKA interface and plugged in an original ST/Falcon keyboard. It made no difference either.

The program still runs, displays the menu screen perfectly, you can move the mouse anywhere you want, but it does not respond to any mouseclicks.

I have a question (since its been so long that I can't remember) - if the cartridge is not plugged in, or working, or doesn't have a video source actually coming into it, it doesn't matter right? The program itself should still run? Can you try yours and see?

Thanks much.

OK, I found it. The 'TOS release notes, 24 June 1993' says nothing about this.

> N.Aes

I think you should use a orignial TOS, if you make tests.

Gerhard

Maybe, but why don't you use objc_draw?

>Maybe, but why don't you use objc_draw?

For speed reasons. If one is to redraw a rectangular area, there is no need to adapt the image data to an icon mask. Hence, a VDI blit directly from a buffer will be (significantly) faster.

Again, does anyone have info on how MagiC handles this conversion? Is the data converted each time objc_draw() is issued, or is a device dependent format buffered somewhere?

/Joakim

Ok then. The most current official TOS version available (the one built-into Falcon, unless I am mistaken) will also behave like Atari Compendium specifies.

That is, even old TOS 4.04 manages the conversion automatically upon rsrc_load().

/Joakim

```

Hello All,

Well here is how it all came about. I still do not hav a desktop envronment, but I am working on it. Of course what I am about to say applies to a Hades, but I am sure it could apply to a Milan, Falcon or TT.

When I first tried to install Sarge, I had trouble from the beginnins just trying to get the ram installation disk to run. I am sure many of you have had the problem of the ram disk quiting saying things like corrupted or missing list. I could not get any farther until I read where the ramdisk and kernel work best when loaded into ST RAM. This is an "-R" in the boot agument. So my installation boot argument is this:

```
-d
-R
-V
-t
-S 200000000
-r cdrom/initrd22.gz
root=/dev/ram
video=external:1024;768;8;p;0x81000000;7864320;0xb0000000;8;svga
load_ramdisk=1
```

```
ramdisk_size=13000
debian-installer/framebuffer=false
```

The -t tells the ramdisk to ignor the TT ram. Note the "-S". This statement does a let's pretend we have this much ST ram. I would imagine all your TT and Falcon owners could do this, but when I split my Ram into ST and TT ram, I have 14meg of ST ram and about 240meg of TT ram. If I leave the -S statement out, the ramdisk still loads because of the -R command, but when it comes to loading and mounting CD disk#1, it stops about 1/2 the way through. You need the -S statement at least I need it. Oh, I forgot to mention I bought the 13 disk CD set for M68k computers.

The video=external... is needed because I have a PCI graphics card.

Of course to boot the Linix partition I use the following if I have split my ram:

```
-k vmlinux
-t
-S 240000000
root=/dev/sda2
video=external:1024;768;8;p;0x81000000;7864320;0xb0000000;8;svga
```

I use this if I have split not split my Ram (all ST ram)

```
-d
-k vmlinux
-t
-S  200000000
-T 200000000
root=/dev/sda2
video=external:1024;768;8;p;0x81000000;7864320;0xb0000000;8;svga
```

It seem things work best if the kernel/ram think you have both kinds of ram. This first time I installed Sarge, I tried to boot the Linux partition using the boot argument without the -T statment in a non-split ram environment and the boot failed and I could not recover, so I just re-installed it again.

Remember, if you split your ram and use the -S statement, you still will only have 14meg of ram to go with. I like the non-split RAM and the -T and -S statements used. This way I know I have enough memory. Oh, notice in the boot argument example the -S statement in lower then the one in the first example. This is because when I set it high in a non-split ram environment, the ram disk crashed like before. If you sucessfully install Sarge and want to change your argument, test it out with the installation ram disk first. If you can get by the reading/mounting of the first CD Rom (must get to 100%), then things will work on the booting of the linux partition.

Two last things to say. In the installation process you will get to areas where you are asked to select things like in the base configuration you are asked to choose packages to install. Use the arrows keys to scroll up or down and use the space bar to select. When you are done, hit Control-i and the cursor will go down to the "OK". Then just hit return. Use the Control-i if hitting the return button does not work .

The other thing is that sometimes at the start, the fonts get screwed up when the ram disk loads. If this happens, reset the computer and run the booting of the ram disk again. Usually on the second or third try you will be able to read what is going on, but the edge fonts will be garbage. Do not worry, it will still work fine.

Well that's it. Try it and let me know what happens. I hope it works for all of you. Take care..

I' m quite sure I bought a floppy extension cable from Cables To Go.
However, they don't seem to have it anymore.

I did find floppy extenders here:
http://www.grendonaudio.co.uk/acatalog/Online_Catalogue_Adaptors___Leads_21.html

Cables To Go will also make a custom cable, although I have no idea
what the cost is.

Galen

I finally had a reason to go try WP on the CT60. Under 256 color and extended resolutions it doesn't work. (The same is true on a regular Falcon.) Under 16 color 640x480 it did indeed work with the CT60 and was VERY fast. There was some minor screen gibberish, but I seem to recall this happens occasionally on regular Falcons as well.

Galen

And knows his gigabytes from megabytes! I doubt if there is such a
creature as a 60 gigabyte MFM drive - they were much smaller in
those days, and even 60 MB was considered big for an Atari...

Regards, /Peter/

I am still having writing problems under Mint after I made some adjustments to my CNF file. I am thinking I need to move where the program boots in the bootup process. What files should run before and after Mint?

There is only one, and only sometimes. Im my EasyMiNT installation on a TT Extendos Gold needs to run after MiNT. The rest need to run before, always.

Jim

Hi all,

Does anyone have the diskette/software for:

MIDI and Sound Book for the Atari ST
by Bernd Enders and Wolfgang Klemme

If somebody can send me an MSA or ZIP file, would be greatly
appreciated.

Thanks
Rory McMahon

No, sorry.. not off the top of my head. I have heard of a couple more apps that dont get color icons under anything but MagiC, and I think I remember that they were apps written for or on MagiC.

I just mentioned Papyrus, because that is one I can test with here.

Best Regards,
Odd Skancke

I was just trying to figure out the "sdmatest.prg" from Didiers site. I
got most of it, but what I need to know is how to change it from 1 voice
to 4.

When running and reading the text, it almost looks like the same switch
"/" is used for both the voices and the frequency.

Thanks everyone.

For those who remember MidiMaze, there is a pretty good clone of it
available now for Windows, Linux, and soon the Mac. You can see details at:

http://www.indiesatwork.com/

Me and a few friends sure spent some time playing the original back in the
80's! :-)

Guys I have a question. I was looking at an Atari hard drive for sale on
Ebay. It says its a SH205.

I thought the SH204 and Sh205 were rectangular "shoebox" style cases, while the Megafile 30 and 60 were "pizza box" style cases.

Whats being shown is a "pizza box" case.

Just curious if I wasn't remembering it correctly.

Thanks.

Dreadnot (sp?)

It was a naval game where you controlled battleships from the WW1 through
early WW2 era, I think?

I'd love to have this if anyone has a copy with docs for sale.

Thanks.

wow, that looks great, I remember playing that in my long ago school days (midimaze that is) great for wasting hours of time, though I just got too good at it and knew those massive mazes a bit *too* well :-p

Chris

Actually guys I knew how to spell the word itself, but many times the
spelling is changed for a title, whether its a book, movie, or in this
case, a game. Thats what I was really asking "(sp?)" about. :-)

Okay, I found some more (non-Atari) info about the game by going to
the "Home Of The Underdogs" website:

A "view-from-the-turret", Dreadnoughts is an excellent World War I naval

simulation that offers an interesting, albeit very slow, portrayal of tactics during the few World War I encounters. The game system was interesting, albeit before its time in terms of computer hardware capabilities. Designer Peter Turcan greatly improved the breathtaking isometric battlefield engine used in his earlier Waterloo and modified it to depict tactical naval combat. The result is a spectacular, unique naval simulation whose beauty is more than skin deep, due to the inclusion of realistic factors such as weather effects and more. Definitely a game worth investigating for all armchair commanders, especially those (i.e. most of us) whose hardware couldn't handle the game when it first came out :)

By Peter Turcan 1992 Datasoft.

I distinctly remember reading a review of this game in one of the Atari Euro-mags from yesteryear - it probably would have been either ST Format or Atari World.

Anyone have this game and want to sell it?

Mike, don't do that. I have no idea how to help you fix it, but if nothing
else give it away for the cost of S&H to someone who might need it for
spare parts.

Atari hardware is getting to sparse on the ground to be throwing items
away - it breaks my heart to read these kinds of messages! :-(

See ya.

No, the SH205 was the first pizza box.

     Hi, Ronald!

Have a look at this clone as well:

     <http://home.tu-clausthal.de/student/iMaze/>

It appears to be closer to the "original" at least concerning the
graphics...

     Regards,

          Alexander

Sure does, doesn't it? I thought I'd mention as well, it looks like Imaze is comepletely free/sourced, while SuperMaze looks like it has some proprietary stuff in it. Just for those who are concerned about such things. :-)

Thanks Alexander.

Hi, Ronald!

RJH> I thought the SH204 and Sh205 were rectangular "shoebox" style cases,
RJH> while the Megafile 30 and 60 were "pizza box" style cases.

Almost: SH204 is "shoebox"ed, while SH205 is "pizza box"ed. It is also
called "Megafile 20" (see <http://www.maedicke.de/atari/hardware.htm>).

Regards,

Alexander

Great :)
I just got my memory for the ct60 so will see if it will fire up (i had
old memory from a pc but was no good) The header can be done..just one
question if i get the floppy extension is there any loss of signal to
the computer? I also need to see if i can still get the usb card from
nature..I may have missed my chance due to emergency repairs to a
crappy water heater line.. thanks for the help :)
Thomas

Not for sure, but I seem to remember that there are two versions of WordPerfect.

One didn't work well or at all on the Stock Falcon030, and the other version ran just fine.

I picked up a Complete version 4.1 of WP lately. At least I think it was 4.1.

I already had a complete version that would not run on the stock Falcon. Not sure what version it was.

Anyone know about this and what version does work correctly on the Falcon?

SuperMaze uses a commercial game engine where source code publishing is
not possible.

By the way: The integrated maze editor is able to read all old
Midi-Maze 1 mazes! :-)

Thanks for the reply, Paolo.

Here is what I've got so far (on my keyboard):

```
SPACE        - starts/stops play
* (<shift>8) - quits out of the program
- and +      - will increase or decrease frequency from 20-50khz
/            - swaps out the master clock from 25mhz to 32mhz
```

Voices...unknown (to me) at this time. The screen for the app says:

'('/')' and I have no idea what that is supposed to mean. Its certainly
not "/", because that swaps out the master clock.

Thats the only one I don't understand.

Thanks.

Also worth noting, the SH205 is worth IMHO less due to the fact that it
has an internal MFM/RLL controller and an MFM drive. You'll be hard
pressed to find one of these drives to upgrade it with. The SH204 has a
SCSI controller which could accept larger scsi drives - I say could
because the Supra shoebox cases/controllers don't seem want to.

The SH205/Mega case however is IMHO the coolest case Atari has ever
produced and would make a good candidate for a MiniITX ARAnyM box project.

Thanks,
Mark

Please let us know how it worked. I am very interested in every
installation report.

I second that, especially since I know about the Atari related bugs in the
Sarge debian installer.

does it mean that you got X11 running? On what graphics card? Starting
GNOME would then be a matter of "apt-get install gnome gdm".

Also I'd suggest you (for perhaps third time) to join the debian-68k
mailing list to discuss the debian issues on Atari and also the linux-68k
list to discuss kernel related problems. You must have figured out already
that the debian and kernel developers do not read this usenet newsgroup.

This would only work if TOSBOX implemented the HostFS NatFeat.

> Because I can't extract single files from the AFROS diskimage

Why you can't extract it? Simply boot ARAnyM/AFROS and copy the files over
to your host filesystem, or just a plain floppy.

Also, the binaries of the drivers are available in source distribution of
ARAnyM. And they're even accessible via the web interface to the CVS
archive.

I have both of these games and the dongles,

Basically, they look like an Atari 8 bit joystick end. Only abit
smaller, and just a wire or two inside
to make a connection. They are very light and almost seem hollow. Mine
is stamped with a AMP
Logo and it looks fairly easy to take apart.

Of course it has the standard 9 pin holes to connect to the ST
Joystick/Mouse port.

One could probably make there own. If you want me to take mine apart
and describe
whats connected inside, just let me know.

For a reason I do not know the new kernel did not boot. I decided to stick to my old Debian installation, which is sufficient for my needs. Compiling a kernel etc. on a TT simply takes too much time to do it more than once ;-).

I recently got another VIDI ST cartridge in very good conditon with the
original box, software and manual.

I've not tried it out yet, but I notice that its design is somewhat
different
than the other Vidi ST cartridge I have. This one is smaller in size
and the
Label is different. Both Carts are black, but don't really look alike.

Anyone know if this change is just the outside cart? Or was the circuit
board
also updated?

Hello,

Slightly off topic this one but wished to post this here where it wouldn't be subject to the regular newsgroup trolls, conspiracy theorists and general lunatics. You're respected!

While developing PeST I've ended up with quite alot of what would be mice leads (we use a PS2 extension cable and cut it in half for the socket end). I've been wondered what to do with the spare bits.

It's occured to me that I could develop a pretty simple mouse pointing device for those who are disabled or impaired. And do it quite cheaply too.

While briefly researching this topic I have to say I'm absolutely shocked at how much companies charge for products to assist the disabled, it's almost as if it's the next financial money spinner and seems very unethical somehow..

What I was imagining here was perhaps something with large buttons for left right, up down, and the two mouse buttons. Or something with light sensors being covered etc.

Any ideas? Any experience?

Thanks,

Aly
http://www.retro.dial.pipex.com/pest/ (quick product plug which I'm at it..)

Sorry if this stuff is obvious but I've had problems with mint.cnf
in the past and it was almost always soemthing really easy that
I just couldn't see.

If your main mint partition is not M: then you will also need to
change these lines:

```
# Links zu EasyMiNT
sln m:\bin      u:\bin
sln m:\lib      u:\lib
sln m:\etc      u:\etc
sln m:\home     u:\home

A few years ago I tried to install Debain on my Milan.

The problem was that the installer would crash and lock-up the entire system.
It was very disappointing to find that the installer wasn't capable of doing a few basic things without crashing so badly.

I had a bit of a chat on the m68k linux mailing list but it wasn't a lot of help.
IIRC they said it was crashing because the system was not recognised. I thought it was poor that the installer couldn't handle this situation and I gave up.

That was when I decided to enhance my minimal Mint installation with EasyMint.

I also had a quick look at one of the BSD systems but the installation was a bit more manual and put me off.

If I ever get FreeMint 1-16 running properly I may give BSD another go.

Peter

I have VIDI ST, not used it for about 6 million years, but maybe its a
colour and mono cart ? I can't say for sure but didnt the colour one have 3
adjustments on the front ? can't really remember... all so long agooo...

I think the idea is brilliant but have no expertise to offer. I can say that PeST is brilliant, I bought one from 16/32 systems and it will make life a lot easier from now on. So glad to see someone still dedicated to supporting the STe and worth every penny. Many thanks

PAUL

Not in the case of a spacecraft take-off or a high-g turn! And Joe forgets that acceleration can be negative as well as positive! :-)
</nitpickmode>

Why not? Problem is: rocket does accelerate, you dont. So again you or rocket flor hits you, or roof, if negative acceleration ;)

As a college professor myself, I'd suggest you go visit the "Disabled Students" (or whatever your local college calls it) center and inquire there. You will certainly find people with vast expertise and limited funds.

If you wish, I can get you in touch with a person who could certainly answer your questions, but she (like I) is in California.

Galen

No need to take it apart. I found one in my stuff. The one i found was
a actually a AMP nine pin connector. And has a jumper from 1-6..

Thanks to everyone for the replies.

Hi all,

Just bought an external 100mb ZIP drive for my Falcon and now need a
cable.   Can anyone tell me which flavour of SCSI cable I need to buy,
SCSI I, II or III? The Zip drive has a 25pin female socket and the
Falcon a 50pin socket (Very small pins - ultra SCSI?)

Thanks in advance.

Dave.

Cables/Connectors cant really be reliably described by saying SCSI I,II or III.

All you want is a 25pin to High Density 50pin cable.

Coda.

I know some others of you have re-cased yor Falcons. Where did you get the extension cable for the floppy drive?

The other Falcon I had (the one I just sold) had already been re-fitted by someone else with a standard floppy header so it was easy to find a cable long enough to move the floppy.

Now though, my current Falcon has the standard Atari floppy header, and I can't find an extension cable that will work. I've got 3 floppy cables that have a header on one end that plugs into the cable coming out of the Falcons' MB, and the other end plugs into the floppy drive. None of them seem to work though. Using any of these cables, I get an error from TOS or MINT/Thing that track A can't be read. Plug the floppy straight back into the cable from the Falcon and it works just fine.

I've already sent an e-mail to Brad at Best Electronics but I just wanted
to see what others have done.

Thanks everyone.

Hi Galen,
```

Thanks for your reply. Oh it's just an idea really.

Oh California, no probs there, please do just bounce this off her but only in passing :-). The device I was wondering would have 4 large 2cm dia. buttons for direction, and 3 for mouse buttons, 1 left but, 1 right but, and 1 left double click. Say a case size of 25cm x 15cm, something that was sturdy and could be used by the feet maybe.

Thanks again,

Aly

Yeah, trackballs seem like quite a good idea really.  The only thing
that occurs would be difficulty with the double click movement.

Yayyyyyyyy :-)  Happy customer :-)  There's probably about 40 of them
out there now.  Quite a few in the USA, a few in Austrailia, and sent
one to Singapore last week.  Singapore!!  Odd place for an ST I wondered
but the guy sounded happy.  :-)
```

Thank you for buying, really pleased that it's meeting expectations.
:-) And for that money doesn't compare.

Aly

Probably not. The Zip drive takes a DB50, I think. The Falcon end is shown as a SCSI 2 in the Best Electronics catalog, and is otherwise known as a HP50 or HD50, depending on where you look. Both ends should be male.

One place to find such is Cables To Go. They have a website. So does Best, who may have one to sell.

Hi,
This is the description of the one I'm looking at...

-- This cable is SCSI II 50 HD M at one end and 25 D M at the other.
-- Suitable for connecting a scanner to a SCSI card.

This seems to match the 50pin Flacon and 25pin SCSI.

Cheers
Dave.

Hi Rory,

Didn't you just know someone would ask you a nasty question?! :-) This one concerns KVM usage.

Referring to your KVM usage here;
http://fujiman.no-ip.com/Eiffel_FAQ.htm

Why doesn't it work? Is there no error recovery code implemented in Eiffel?

Reason why I'm asking this is that I'm trying to unravel this one fully myself. It's partly explained here but doesn't apply to all digital KVM's, only some; http://www.retro.dial.pipex.com/pest/q&a//index.htm

I'm assisting a customer in determining if Eiffel or PeST would be best for them. They would like to use a digital KVM but I know that only the KVM's which don't mess about with the PS2 packets will work. Technically Eiffel would work with some digital KVM's in the same manner that PeST will, in that some digital KVM's behave identically to manual KVM's. This centres around how you initialise the mouse, as you have to be able to detect a disconnect in order to enable Status-Reporting else your mouse will just sit there. PeST will detect this. If Eiffel has problems with ALL digital KVM's then this has got me worried somehow.

Any ideas?

Thanks,

Aly

> about before spewing such nonsense

hmmm.. let me see...
Mega ST4 == Mega ST4 check
Megafile << ICD Link (free clue, how many drives do you think that
you would be able to find that would work in a megafile v. SCSI? IIRC the
MFM drive used in a megafile is NOT compatible with IDE, meaning that
you'd either pay ALOT for a new drive if you could find one or pay ALOT
for a used drive of doubtful provenance.)

so, we have a more limited system that went for $275 USD on ebay ~1mo ago,
and this guy is offering a measly $100 for a much more flexible system
with the only difference between the two being one sold with a megafile,
and one that wants an ICD link which look to be rarer than megafiles ATM?
WTF?!

(This was MEANT to left as a trivial mental exercise for the observant
reader to figure out on their own.)

P.S. I hope that the multisyllabic words and contractions don't confuse
you.

There are no nasty questions... At best, I can give an answer, at
worse, a wrong one. So fire away. LOL...

>Referring to your KVM usage here;
>http://fujiman.no-ip.com/Eiffel_FAQ.htm
>
>Why doesn't it work? Is there no error recovery code implemented in
>Eiffel?

I dont know if there is any code in the eiffel firmware for recovery.
I have not had a chance to look through it. I would imagine it has
some. I have tried hooking one up to a non powered kvm (one that does
not have a power adapter), where the keyboard would work, but the
mouse would not. I will have to run a few more tests and see if the
board may need modification. If the kvm is pulling power from the ps/2
port, im wondering if the atari can support more power or is there a
limit for the keyboard circuitry. And why the keyboard works, yet the
mouse doesnt?

>Reason why I'm asking this is that I'm trying to unravel this one fully
>myself. It's partly explained here but doesn't apply to all digital
>KVM's, only some; http://www.retro.dial.pipex.com/pest/q&a//index.htm

Perhaps that there may be on digital kvm that would work. I dont have
the resources to procure and check each one. The one I bought
(miniview 4 port) doesnt work fully with the eiffel. I pretty much
stopped there. I had already bought the cables, so it now is hooked to
the PC's I have. I went and bought the mechanical one for $17 at a
local shop and it works fine. There is definately a need to see if
another works, but only if time/funds permits.

Or, design one to use some soft touch buttons and solid state relays to switch signals. Another PIC project? Anyone?

>I'm assisting a customer in determining if Eiffel or PeST would be best
>for them. They would like to use a digital KVM but I know that only the
>KVM's which don't mess about with the PS2 packets will work.

Well, I think we all agree that the Atari mouse rates a -10 on a scale of 1 to 10. I have gotten better resolution with a string tied to a brick. Anything is better than the Atari mouse. I would much rather use the keyboard...

I think Didier may have wrote and updates the firmware for the Eiffel. I have not asked him if the code will support a digital kvm. It may be in the works. As for writing code for a PIC, um, I cant do it. I'm the guy who sometimes picks up the right end of the soldering iron. Those days, I put some boards together, test em, and send em out. The other days, I nurse the wounds and try again soon.

>Technically Eiffel would work with some digital KVM's in the same manner

>problems with ALL digital KVM's then this has got me worried somehow.

Well, I would like to get these little things ironed out in the near future. I'm not sure how much of the firmware would need an overhaul. I'm not able to do this. The Eiffel is open source, so it is available to everyone who wishes to modify to suit. Meanwhile, the manual switchbox is working. We have some APEX boxes at work, so I could try it out there. I'm not sure if people want to shell out a lot of money for a APEX. The box would cost more than the computers combined. LOL. The mech-switch box is a cheap & easy solution. Yes, they wear out, but it is pretty cost effective. Until I find one that works properly, I will probably use a manual switchbox.

Ok, its late here and I'm rambling... Somebody cut me off! :)

Rory

I unsoldered the attached cable and put a dual row header. I then modified a PC floppy cable by reversing the 9 through 16(i think) wires in the cable. A PC cable A: drive has the wires reversed. You just switch them back to normal cable. I've taken a few round cables and they work fine.

I can do this if needed.

Thanks

Since I have an a Mac Mini I use a TK-210K (TRENDnet) switch who works
fine with my current unfinished release of Eiffel. Sometimes there are
problems during reset, the mouse not works. Normally it's OK after
another reset.
I have no time for finish this update since I work on the CTPCI drivers
(today the radeon driver). So please wait some months (like the
Aniplayer DVD release).
About Eiffel you need to select the set 2, the set 3 has no chances to
works with KVM switchs.
The TK-210K use a PS2 mouse/keyboard for switch between USB machine and
a PS/2 machine.

Regards,

Didier.

```

I quite like that answer :-) Very honest.

Yep, agreed, digital KVM's which pull their power from PS2 ports galore would definitely pose a problem. Mmmm, hadn't thought of that. I used to work for a big ISP on Cambridge Science Park and we had racks and racks of servers, the digital KVM's used to cause us all sorts of problems so we went back to PCAnywhere/variants for an easy life. Couldn't have live hosting servers becoming randomly unaccessible, was a bad move really although they were left in place and we took a chance.

I think thats what somebody had done to the Falcon I sold. It worked
great, except that, as you mentioned the wires were reversed. Since it
will fit, I just flipped the end connector over before hooking it to the
floppy itself.

Let me see if I can find/obtain a cable that will work first, then if I
can't, I might take you up on your offer. :-)

Thanks much!

Thanks for replying Mike. I played around with the flags on it, can't seem
to come up with a combo that works.

I do have the DEKA interface in my recased Falcon. I'll switch out to a
standard keyboard when I get a chance and see if that makes a difference.
10 years ago, I had a Nemesis equipped Falcon, and IIRC, VMF worked okay
with it. Wonder what it is about the DEKA that it wouldn't like? I don't
think I've encountered any other software that doesn't work with it.

I don't know. But I know that there is no doc which say what format the CICON
have after you load they with rsrc_load. So you must use objc_draw.

No, I have not gotten it to run as yet. I did have it up and running with the SLINK version though, so I am sure I can get it working with SARGE.

Yes I know thanks for reminder. I plan to put my Mint Partition on a 2 GIG Jaz cart, so it will change from M to K.

How much memory did you have in your Milan? Does it have TT and ST ram?

Yes I have done that. I put my vote in and I noticed the count was almost up to 40, so here's hoping it gets to 50.

If these are cables from a PC, have you tried plugging them into
the drive upside down? ISTR that for some reason there is a
difference on the Atari from PC. Also, make sure that the cables
don't have any wires crossed. Are these the usual flat cables with
cripm-on IDC connectors?

Regards, /Peter/

 I have a question related to MagiC and color icons; Does anyone know
why some applications, Papyrus for example, does not get color icons
under N.AES (and XaAES)? I have tried to investigate this, but ended up
just as clueless as before I investigated.

 Best Regards,
Odd Skancke

Hi;

Apparently Mint permits the user to create a symbolic link in a FAT
partition on which "NEWFATS" handling is enabled and "VFAT" extension is NOT.

Is it wise to use this capability if such a partition is later to be accessed
from single-TOS as well, or would it be eventually considered as corrupted
in single-TOS;

Thanx in advance.

cu;

Hi,

As Lp mentioned this is covered in the Atari Compendium. In Appendix-C

(Native File Formats) you can read the following:

"CICON Images

All color image data is stored in VDI device independent format on disk
and is automatically converted by vr_trnfm() upon rsrc_load()."

Hence we are facing yet another shortcoming of MagiC it would appear.
However, I presume it should be possible to manually call vr_trnfm() if
MagiC is detected.

He didn't say they were the same, similar....
He's saying the two units were sold as a package.

Hi Edward,
T Bird is alive and well and a regular poster at Jaguar Sector II Forum, he has indeed been the target for criticism in the past which has clouded his attitude toward the Jaguar fan base, rightly or wrongly I cant tell cos I wasnt on the scene at the time this was all happening.

I have noted he still puts the occasional copy of Battlesphere gold up on eBay and they always go for in excess of $500 so he still has some stock of them. Ive seen 2 sold by him in recent months. Under his e bay ID which is something like Misterincredible or Captainawesome or similar. All the time he can make $500+ a copy you can bet he wont be interested in selling the rights.

Scatalogic/ 4 Play T'Birds company that developed Battlesphere are still a going concern and so the copyrights to the game are still actively protected.

Chris

I did (briefy) consider finding some sort of box that would do this
but I don't really want to add to the clutter of wiring.

I am looking for a 802.11g wireless nic that is either Realtek rtl8193
or NE2000 compatible.

I currently use the rtl driver but assume the ne2000 will work just as
well.

Peter

Well I am still having a little problem in getting the X11 environment to come up. I had it up and running a few years ago when I ran the Slink version of Debian, but Sarge is much bigger and may take me longer to figure out. People on the Debian usernets say it may have to due with memory. I have 256meg of memory, so I think it is another problem possibly in my boot argument statement. The rest of it comes up fine, I just do not have a desktop enviroment yet. Also, my sound and ethernet cards are not recognized, but when Linux does a PCI scan, the hex numbers come up fine for each card. When I get it all up and running I plan to compile a new kernel which I hope will solve all this.

It basically looks like a cap that covers the joystick port and connects a combo of two or pins together. I remember reading an article about how to make one on the NET.

I am fiddling around with Debian 3.1 also on my Hades and do not remember that loading with. Infact, my Realtek Ethernet card is not recognized either. It may have to do with the fact the module is not yet built into my kernel which is old (version 2.2). I notice that kernel 2.6 has some eithernet modules in it but I cannot use it until I compile it for my Hades. What kernel version do you have? You can get on the Debian website and look up your kernel and go inside and see what modules it contains. I know you can load in modules, but I am a beginner also. I did just get the Sarge to install on my Hades and it works fine except for the X11 environment. Are you using CD rom's? I would think the driver you want is on one of them. I know the "dpkg" command loads in and manages the packages of the Linux system. That may be a way to put it on your system after you install it.

I have downloaded the Debian 3.1 net installation CD, which offers a 2.2
and a 2.4 kernel. I want to use the 2.4 kernel. What I am doing right
now is compiling a 2.4.31 kernel on my TT, which has all the drivers I
need included. I should then be able to use my own kernel for the
installation process.

For a start I just want to check if the 2.4 kernel works for me at all,
before starting the time-consuming installation.
This is a waste of time anyway because I do not really need a 2.4 kernel
;-). I just run Linux on my TT because it is a quite convenient way to
back up my TOS partitions by transfering them to my PC via Ethernet.

AFAIK, the Hades060 needs fpu__3.prg to emulate some missing
FPU-commands. You really needs it. I start it once from autofolder
(very first prg) but as MiNT kills fpu__3.prg I restart it again from
mint.cnf

So okay, since some people just DON'T get it, allow me to explain. The
guy is looking for a Mega 4 and a Link 2. Since a Megafile 60 is a lesser
drive/controller compared to a link/2 and what it can offer you, it should
in theory be worth less. Therefore the guy was pointing it out to
indicate that what you are asking for should cost more than double what yo
uare willing to pay. The computers are the same part of the equation.
There's nothing I love more than people yelling at other people with no
reason at all.

Okay?

Mark

Will this work? You need some way to select network, configure encryption (if needed) etc. I don't know how this is done in Linux, with ifconfig perhaps? Anyway, I don't think any current NIC-drivers for MiNT-net support wireless NICs.

One has 2 megs of RAM and the other has 4 megs of RAM. My question is,
where did you find -> 2 <- STacys for sale!?, and do they have another one?

  :-)

Hmm, don't remember exactly. I'm pretty sure it was a couple of months ago
though and I got it about a month ago (this is approx.).

Looking to buy working ADSpeed 16 for the 1040STe.

Also looking for working Switchable TOS 2.06/1.62 for 1040STe.

And a 1.44 High Density Disk Drive kit for 1040STe.
(Or good directions on how to do this myself)

If you have either for sale/trade, contact me at e-mail below.

Thanks,
phantomm@bellsouth.net

Cuando ten�a una configuraci�n como la tuya, usaba:

1st Word plus. Muy r�pido, pero trabaja s�lo con los fonts de la impresora.
Marcel. no tan completo, pero usa RTF como formato, por lo que es f�cil
intercambiar archivos con otras plataformas.
Calligrapher. El m�s moderno, usa modo gr�fico, o sea es WYSIWYG con GDOS.

Lamentablemente ya no los tengo m�s...

Saludos!

Daniel (tambi�n chileno)

This subject came up some time back, and I finally managed to get around to experimenting a bit with my CT60 Falcon.

There is mixed news here.

The movies I made from VideoMaster Falcon about 10 years ago, all play just fine, using the small .TTP player program included with VMF. This is under plain TOS. Under MINT/Thing, they play, but when they exit out, the desktop pallette is mixed up. Its easily fixed though, by just quitting thing and restarting it. (this is with NAES v2.0).

The bad news is, that currently, I can not get the main program to run correctly *anywhere*. Under TOS, or MINT/Thing, it will start, open up its main window, and the refuse to respond to any mouse clicks. The mouse cursor moves, you just can't click on any tabs, buttons, nothing. So you can't even exit out from it. I had to reset each time. When it is running, I am getting sound from the VCR coming through my speakers. No video though. I'm not sure if its something I'm not doing right, or something I've got hooked up wrong. This is a Wizztronics case with the cartridge port extended to the rear of the case. I've double-checked the red pin/cable and its correct. I've also got the MB mod, don't know if that affects it or not?

I'll play with it some more and see if I can figure something out.

If anyone else has any suggestions, I'm more than open to them! :-)

I'm not sure a pic would show much. It small plug with a standard 9-pin joystick connector on one end and the other end capped off. Mine is roughly .6" on each side and .3" thick and is black in color with a red cap. Only text of any kind I could find says AMP in rather small letters. Hope this helps.

A small point of order... it's not really the acceleration that's the problem.

As a friend who tests elevators is fond of saying, it's not the fall that'll kill you. It's the sudden stop down at the bottom! <G>

Ok, then I will keep it. You guys see anything that would cause my problem.
Vfat on the C parition is a no-no, so I will take that off. Funny how
eveything worked before.

I did some extensive digging yesterday and you are probably right about needing some extra tools to configure the driver/card.

There may be some cli ones that could perhaps be ported but without a driver it's not going to be a lot of help.

Peter

Actually I just found this thread:

http://lists.samba.org/archive/wireless/2003-October/002653.html

which suggests that the wireless nic can be configured using
ifconfig. I don't know if the Freemint version of ifconfig
would support this at the moment.

According to Einstein the immense decelaration you experience
when hitting the ground is just the same as if you were immensely
accelerated by the ground suddenly shooting you up in the air. :-)

So if one talks about high acceleration one is almost always talking
about hitting something. :-)

Hey Patrice,

I actually did read the docs, and I'm a huge fan of your work. However,
as I understand it, xbios audio should work under MiNT, but I don't get
any sound at all...
 - something to do with threads? The SDL lib used when compiling doom
had threads disabled?

I may have misunderstood something; after all, my native tounge is not
english..

Hi all,

I am hoping Andreas Kromke or any other MagiC wizard may be reading
this forum still. The question I have is as follows:

When I load an RSC file containing CICONs, I use RSRC_LOAD(). Now,
under XaAES/NAES this call ensures that the CICONs loaded image data is
also converted to device dependent format. However, under MagiC, this
is not the case. (If I try to blit with vro_cpyfm() directly from the
RSC icon image data, I just get garbage on screen. With N.AES and
XaAES, the gfx output is perfect though)

Does someone know if MagiC does this conversion for each and every
OBJC_DRAW()? Or does it store the converted image data in a buffer
somewhere? If it does, where?

Please help!

/Joakim

> Hmmm??? Did not know that. I am hoping I can figure out something.

Please note that not only programmers but also pure Debian users are needed now. Right now Debian needs to see at least 50 users or they might stop the entire m68k port (and that would basically mean end of Linux on Atari).

http://lists.debian.org/debian-68k/2005/10/msg00002.html

Please if you are using, trying to use, plan to use or have been using Debian Linux on Atari then don't let it die.

Petr

The chances are that the rubber cup is torn near the carbon bush
that actually makes the contact to the motherboard grid. This is

quite common for heavily-used keys on Ataris - I've had to replace over a dozen on 3 machines. If you can, fit a replacement. Best do a nice set of 'TT Keys' with stiffer 'springing', but are a little expensive. If you can't find another keyboard to canibalise (actually it might be worth while buying another ST from a thrift shop or similar) then swap the 'V' cup for another one you seldom or never use, such as the accent grave/macron next to the Backspace key.

Regards, /Peter/

Okay thanks. I'll have to look around and try to find it.

I've had some partial success. Without doing anything but changing the

68020 file for the 68060 one, I can play MP3s, with about 10% usage according to Aniplayer. The sound is clean and sharp. Here is the ugly part - if I try to play .OGGs though, the usage goes to 460% or higher and it continuously replays part of the song every couple of seconds before moving on.

This now applies to movies as well - usage goes to 700% or higher, and the movie video/sound replays itself, skips, etc,...

Since I can play MP3s, with low usage, and very clean sound, does that mean I still probably have a problem with the SDMA clock, or perhaps I just don't have Aniplayer (or something else CT60 related) set right?

I still can't play PMDOOM with sound either. Rocks, very playable with the "-audio off" switch in use though.

Thanks everyone. :-)

I looked on Rodolphes' site but I still want to ask:

Can CT60 owners please post a list of what AUTO folder programs, ACCs, and CPXs they are using? I don't use MagiC/Jinnee so I don't really need that info.

I'd just like to get a feel for whats being done here.

Thanks everyone.

Nope.
And it makes me afraid of what a Mega STe would go for, let alone a
> TT or Falcon...) I'd bet that shipping on it was c. $50 as well...

Yep, I bought the Mega ST 4 with 30M harddrive. Neither work. And the
1600 games and other programs that came with it. Nearly all useless
diskettes.
Sometimes you win on eBay and sometimes you tale a licking. But where else
are you going to get old computer stuff at prices that affordable. In the
long run,,
I come out OK, even with some miserable buys (about one-third of the time).

Yeah it takes the Hades about 8 hours to install the base and the Gnome desktop environment. Luckily I did not need the computer for anything.

Hi

Thanks all for this info. I picked up one of these for free recently. Tested it on a PC & so far it works fine so it looks like I've got myself an excellent Atari printer.

Maurice

Hi Ben,

Have been trying to mail you but your replies comes back as emails with nothing in them (getting paranoid). I'm interested in one of your books and trying to find out the UK postage costs or if you'd be interested in doing a straight swap for one of the PeST mouse interfaces.
http://www.retro.dial.pipex.com/pest/

Thanks,

Aly

Hi again Ben,

Have just picked up your messages, eventually telnetted into the POP3 server as my provider recently overhauled their web client to make things easier....

Awww, really dissapointed. Have been hunting for that book for ages :-)

<<ST Disk Drives:Inside and Out>>

Is earmarked for Exxos's and my next embedded ST project.

Thanks again for replying several times, apols. Keep up the good work. :-)

Friendly regards,

Aly

Hi,

in the aranym/AFROS package there is BetaDOS included with a driver that allows accessing files with long names in Linux folders without MinT, only with TOS 4.04 and BetaDOS installed in the AUTO folder of an aranym partition.
This worked on my former Linux system and now I need this BetaDOS driver for testing with the emulator TOSBOX running from MS Win 98. This could be the solution to access the files with long names of the VFAT system.
Because I can't extract single files from the AFROS diskimage, I need help from people who have aranym/AFROS installed.

TIA, Ludwig

   Tested it and the laserjet 4050N also works with the deskjet 500 drivers
at
300 dpi. Great for any older software.

               Maurice

Hi,

I noticed that there was a list of AUTO folder programs on his web site. Does anyone have any 'bit' settings for any programs using FILEINFO.CPX?

It would be nice to have the list (as a table) redone with FILEINFO information. Something similiar to:

(This is not actual settings)

Pagestream1.8b Fastload:NO TTPRG:YES TTRAM:NO

Does anything like this exist? Should there be one?

Thanks
Rory

You do realize that a Mega ST4 with a plain ol' megafile 60, IIRC, sold
for about double this price on ebay a few weeks ago, right?

Thanks. I did most of the cleaning, but still need on working out a way to free the mainboard.

The keyboard went through cleaning, and everything seems to be working ok. The rubber cups didn't look to be in that bad of shape yet, but yes, if I can find a plain old ST at a thrift shop locally somewhere, I'll probably snarf it up for parts. (Actually, I, briefly, tried this before resorting to ebay for the STe, and didn't even see anything Atari. I even hunted through a local flea market(HUGE) hoping to find someone selling some old systems, but no such luck other than a couple of vendors selling NES and more recent vintage video games...

AFAICS Ataris are pretty rare on the ground in the US... that or they're still sitting in someone's attic/basement/garage or have already been landfilled... (I should've tried that Atari swap meet in Ohio, but it would have been a longish(and expensive) drive for not knowing what would be there... I'll have to look around SW Ontario when I get a chance as well...)

As I wrote a few days ago, I have the same problem with Aniplayer and OGG:
OGG doesn't work (aniplayer can't find the SLB!) with 060 OGG SLB, but it
works (Sssslllloooowwwwwww) with the standard SLB.
No problems with ANY OTHER SLB. And my SDMA is just fine! (ask Rodolphe :-)
)

Hmm, how do you know its not finding the '060 version of the SLB? Maybe
thats my problem as well. If I try to play an OGG, it reports something
like 460% usage and skips badly.

Does fine with MP3s.

Thanks.

Thanks SWE. Thats pretty close to what I'm using. I was trying to only
load up the bare minimum needed (ACCs/CPXs as well) until I got all my
problems ironed out.

Hello all,

This is for all you Mint/Mintnet people. I have mentioned that my Mint setup had gone bye-bye. I did back it up and will re-install everything, but I have a little problem. For some reason in the Mint environment, if I try and write something to any partition, floppy or otherwise, the fat table seems to get messed up. All the file names turn into garbage. I have a setup where I can boot up Mint without Mintnet, so I can view an EXT2 partition. I tried to change a file name on the HDDriver utility program and that wiped out the whole partition fat table. Luckily I was able to re-install everything back with some backups I had. Anyone know why this is happening? The last time I tried to boot up MintNet, all the files in the Mint folder was wiped out. Below is my mint.cnf file. If there is anything funny in it, please let me know. If it is ok, then it must something in my auto folder that is doing it.

```

Don't use VFAT on the boot partition.

```
>
> # Gluestik - STiK/STiNG to MiNT-Net gateway

```

What is this? Gluestik drivers or what? That's really old stuff. Get ride of that. Use gluestik.prg as found in the freemint 1.16.1 release.

Note, your reported 10% cpu with MP3 is due to DSP. Try to disable DSP, u will get much higher cpu usage for MP3.. and 460% usage for ogg just means cpu is too slow ;) (or that the routines are slow ;) OGG is afaik more demanding as MP3 and that may be a problem

  Well if u use MiNT (i think Magic offer that as well), u better Load/Unload
ACCs on demand. I use preety small number of ACCs (STGuide, Freedom, Control
Panel and NewAlert) and load others if needed...

Well lets imagine i understood this :) Imho u should use Signum. Great text processor, also very features packed. Maybe some older (4) version will eat even less memory as latest... If u need less features, i would go with Everest editor....

```

This also calls for trouble, this GS is old, VERY old, use PRG included in MiNT 1.16.x...

I repaired a Mega STE keyboard which had a broken track on its membrane with
the product used to car fix rear window demisters. Obviously you would first
need to discover if there is a faulty track! A visual check could be enough
or a multi meter to test continuity. Of course dismanteling may not appeal?

When playing around with the Debian 3.1 installation CD I noticed that
the Riebel ethernet driver is not installed during the installation
setup. Is this driver not included in the Debian distribution anymore?
My old setup (with kernel 1.0) still includes this driver.
Hints how to load the Riebel driver module in order to run/continue the
installation are appreciated.

Ah, I see. Thats with my 95mhz CT60 and 256 megs of SDRAM. Guess OGG is
gonna be verboten for awhile then... :-)

Thanks.

Hi Ronald!

Your System could compare to an iP54C/200MHz!?

95MHz of 68060.... amazing.

Best Regards,

Daniel Mandic

P.S.: I have had 60MHZ (OC 50) MC68060 - A2000

  rev6 060 can go up to 100, 105 was reported as well. But most of rev6 are
stable until 95mhz. Mine works ok at 100 BUT tends to do some unexplained
freezes at random time...

You can get a small stiff glass-fibre brush specially made for cleaning contact pins and PCB tracks (mine came from Maplins, but most electronic parts stores should have them). There is also a switch-cleaner spray available that removes oxidation on pins etc.

>> V key is not registering. Any common problems with keyboards other than

Agreed that another keyboard is much easier, but repairs can be done with a bit of care. Make sure you rest the very edges of the keyboard on a coupe of thick books so that none of the keys are pressed down when you remove the PCB after undoing the 30 screws. And do that carefully, hinging it backwards (away from the edge of the table) so that any rubber cups that are sticking to the PCB do not fall on the floor. As I said in an earlier posting, it's quite possible that the 'V' cup is torn if it's seen heavy use, and if you don't have a spare, change it for one of the keys you seldom/never use, such as ` (next to Backspace).

Regards, /Peter/

DDP Translations at your service! [Items in square brackets added]

     Screen flicker

     With some older systems [i.e. hardware], screen flickering
     can occur after some time. This fault appears over a given
     temperature range. Swapping the video shifter and MMU merely
     alters this range. The remedy is to solder a capacitor with a
     value of 3-10 pF (picofarad) between pin 39 of the video
     shifter and ground.

[Q]  Who can tell me why the grey background of the screen image
[A]  flickers slightly with disc accesses?
     Amplify the RESET signal at the DMA output via a 7407 [IC] (not
     the LS version!) with 1 kOhm to 5 volts, and the effects will
     no longer occur.
```

[Q] Flicker, tearing [?] or star formation on the screen?
[A] Solder a capacitor of 10-120pF between pin 36 (16 MHz out) of
     the video chip aand ground. The value must be found by trial
     and error!

Regards, /Peter/

Well, the latest version 1.29 of the Thing desktop (shareware)
allows you to install single 'Quick-start' keys, but unfortunately
the 'Extra/Quick-start key' menu item is not described in the HYP,
which is for V1.27. And I haven't found a way to make it work :-(

But you can have 10 more by allocating the function keys F1 to F10
with the 'Extra/Function keys' menu entry.

However, if you allow not *one* key but *two*, you can install another 30 with function+modifier key in 'Extra/Function keys'. From the HYP:

"This dialog offers separate pages to assign Function keys alone and in combination with [Shift], [Control] or [Alternate], as well as allocating entries in the 'Tools' menu.

"Key allocations are evaluated as follows:

"If only a filename is entered the relevant file will be opened when the key/combination is pressed, taking into account any applications installed for it.

"If the file is a program then it will be started, of course; optionally one can also specify here any command line parameters to be passed."

Finally, the 'Extra/Applications' dialog allows up to 9 programs to be launched with ALT+number key. From the HYP:

"Shortcut: In this popup menu an [Alternate] + number key combination can be assigned as a keyboard shortcut to launch the application...."

If you don't use Thing, the (commercial) Jinnee desktop offers similar facilities.

With other desktops, macros can be executed with the help of the Harlekin desk accessory, which allows you to define your own. This was commercial, but has been on cover disks and I think can now be found on the web.

Regards, /Peter/

Hi Patrice,

I see you have created a list of compatible pci devices.
http://perso.wanadoo.fr/patrice.mandin/v3/en/perso-pci.html

I am considering a wireless lan adapter. Does anyone know of any that
will work with the available drivers ?

I have used a Canon bjc-2000 for a few years. I use the bjc-620 driver but
have tried some of the others in NVDI.

I works fine in 360dpi mode but printing in 720 dpi mode results in
tall images.

This problem was discussed with 2B and they blamed the application but
since it was happening with all the apps I tried it could only have been
the driver.

Looking to buy a ScreenEye Digitiser for Atari Falcon030.

I am in the USA and doubt that anyone in the US has one for sale, but if so contact me with price.

I thought that I might find someone from overseas with one for sale. If so, do contact me as I am most interested in finding a good working one to buy.

I also will buy non-working ones as well.

I have the general software for it, but I think it's in German, so I would like a English version of the software if possible.

If I am not mistaken, the ScreenEye was made by a company in Germany and sold by Titan Designs.

Anyhow, would very much like to get one or more of these.

Contact me with info and asking price.

Thanks,
phantomm@bellsouth.net

Help me to understand:

You have your TT's ethernec connected(plugged) to the
DWL-810(ethernet-to-wireless bridge), and that connects wirelessly to
the wireless router on your peecee?

Thanks

Hello. I'm looking for, in particular the PC2, but I'm not ruling out
the other Atari peecee's. Also looking for ST stuph. I have a 1040ST I
pulled out of someone's garbage...in pieces. Haven't had time to mess
with it. chrism3667@y-a-h-o-o.com. Grassyass.

Say what ?   A Mega ST4 and a Megafile 60 are NOT even close to the
same. The Mega ST4 is a 4 megabyte computer and the Megafile 60 is a MFM
60 gigabyte hard drive.  Be sure you know what the heck it is your
talking about before spewing such nonsense

> After finding out, quite accidentally, that baby wipes[0] are good for cleaning all sorts of things, I use them for cleaning keyboards and the like. You will, of course, need to make sure either you've removed the motherboard from the case or disconnect it from the power before giving it a clean.
>

Thanks for the tip, and I'll be careful with [0] as I can't stand the smell myself. (Heh don't clean while powered on! I'd bet that would be an electrifying experience! };)

<lots of stuff about keyboard/ports assembly/cleaning etc and sig snipped>

Thanks for the tips. What I expect that I probably will end up doing is taking it apart, and while apart for keyboard cleaning, wipe down the empty plastic shell.

So, how are those Acorns? I looked into buying a recent model from Castle IIRC several years ago, but they were somewhat expensive, and I doubted that there'd be all that much interesting for them. Not to mention if they didn't use a "universal" power supply I'd end having to replace it, but IIRC they were just plain old ATX PS. (Ended up paying attent more to the Eyetech stuff and possible new Amigas, but not much was happening at the time then the first one seemed to have all sorts of, essentially, fatal hw problems... Not to mention why bother buying a new one just to have to emulate the old machines and NOT having a GCR floppy... sigh...)

thanks
john

D-U-D-E!!!! STOP RIGHT THERE!!!!!! DO NOT USE ALCHOL!!!
last time me and alchol got around arcrylic or plastic it shattered..
i own four atari type computers and have maintained them with a mild mixture of common cleaners........take a shot glass   put in a half cap full of bleach ,with a drop or two of dish soap ,fill the remainder up with hot water.....now the procedure,   get an old tooth brush and some paper towel dunk the tooth brush and let drips back in container not too wet !!!!
now paint the area to be cleaned even scrubbing if need so , then wipe down with paper towel. works great for me.

ok ,pay me later.
charles ,ha ha ha ha ha!!

On Fri, 23 Sep 2005, cutterjohn <someone@nowhere.com> wrote:-

<snip>

>So, how are those Acorns? I looked into buying a recent model from Castle IIRC several years ago, but they were somewhat expensive, and I doubted that there'd be all that much interesting for them.

To tell you the truth, they rarely get much use. The same goes for the Falcon and STE. Occasionally I'll hook them all up and check they still work, sometimes play with some of the software installed[0] and then power them down again. Unfortunately only the RPC has somewhere close to a permanent location, but is usually untouched. The A3010, A4000 and both Atari machines are presently stored out of the way.

>Not to mention if they didn't use a "universal" power supply I'd end having to replace it, but IIRC they were just plain old ATX PS.

Not sure just what sort of power supply they use but, from the last time I looked inside the RPC[1] I'd guess they're more like an AT type rather than an ATX. AFAIK they're fixed voltage as well, which would mean either sourcing a 120V PSU or getting an inverter so you could run them at 240V.

>(Ended up paying attent more to the Eyetech stuff and possible new Amigas, but not much was happening at the time then the first one seemed to have all sorts of, essentially, fatal hw problems... Not to mention why bother buying a new one just to have to emulate the old machines and NOT having a GCR floppy... sigh...)

Can honestly say that, even though I've been offered a few Amigas (A500, A600 and an A1200) they've just held no interest for me. I actually used the 1200 for a while before deciding that they wouldn't be worth it to me. They'd probably end up with less use that the machines I already have.

[0] Acorn Elite is one cracker of a game. Much better than any of the over versions I've seen, and a little harder in some respects[2][3]. Plus you can get the furry dice addition[4] :)

[1] about 5 minutes after it arrived as I was swapping out the two 4MB SIMMS for a couple of 64MB SIMMS, checking the processors to see what speed the 486 was and if it was equipped with a Strong ARM. No such luck, it only has an ARM 6 processor. Good enough, but a Strong ARM would have been nice.

[2] roaming bands of police vipers patrol the systems. In the more civilised systems they will attack you if you're an offender or fugitive, which can be a bit of a pain. Other times they come in handy as they sometimes come to your aid when you're attacked by pirates.

[3] if you don't have a docking computer you can dock manually or, if
you can afford it, pay for the stations computer to do all the docking
control instead.

[4] They hang off a rear view mirror and, for real novelty value, they
even swing when you change directions.

Regards,
  David Bolt

<cough>
It's semi-official, I'm an idiot. I was just looking at the ICD Driver
control panel and just NOW noticed: hey! a sense codes button, well let me
click. Guess what pops up? A window entitled common sense codes, $04
drive not ready!

(I guess I was sort of thrown since the manual(yes I actually got a copy) says about sense codes(paraphrased): good luck. each controller defines those not 0 or 127 as whatever they feel like, please don't bother us, find them on your own...)

(...and another thing is for sure. The next thing that I need to do for any of my systems that don't have harddrives is to acquire controllers and drives for them some how...)

Ooops... In that case, sorry to have confused
the issue with those SCSI Tape sense codes.

Anyway.. At least it wasn't a serious one!

Steve.

well here i am again giving seeming sence-less rable out at will!!!
ok i too have a st-fast drive,when i bought it the drive contained all sorts
of odds and ends ..so i went and bought a icd version 6 disk .
this took care of formating and everything i wanted it to ,ddrive
identification,partioning etc,etc,...inmost cases there is a seagate drive
and a adeptec within a fa-fast . if you correspond to me outside this group
i will meet your demands...and answear all questions to the full extend of

my knowledrge.

charles
ps so did mine(errror code o$4)
yeah yeah!
oh ps===late night....>>>>>f`riday 3:00 am

Well, Mpeg and OGG... maybe you need to check for the correct location of
the SLB files. By the way, I can't get OGG vork with the 030 library, I need
to use the 68000 one :-/

Well, I'm using Naes 2.0, if that makes a difference. It shouldn't, I would imagine.

I did have the slb files in the wrong place. I copied them into the Aniplay folder but is that the right place?

What settings are you using, if you don't mind my asking?

Thanks!

Well, where exactly is the correct location? The setup app installed them
to C, so I moved them back into the Aniplay folder but is that the right
place?

I don't even know which library I'm using. :-(

You can have your SLB files in your Aniplayer directory, or in another
directory like C:\SLB\ or wherever. Then you have to define an environment
variable SLBPATH=C:\SLB in mint.cnf, xaaes.cnf or n_aes.cnf so that
Aniplayer can find them.

Thanks Martin.

Well, I've made *some* progress. With the *.SLB files in the Aniplay folder, and d2d off, I can start a MOV, AVI, or MPG movie. It starts, then it always says the sound system is already in use, then I get an "Aniplayer has performed an illegal instruction" error.

Am I supposed to be copying any of the '060 files? How about memory? Am I supposed to set Aniplayer to fast RAM only or vice versa?

Thanks everyone.

Okay, now its weird. Just for the fun of it, I put Aniplayer v2.07 back on.

Ran it - it runs the AVI videos I've got okay. Sound is a little fuzzy,
but that may be the file itself. No crashes.

So what the diff in 2.22 and 2.07 besides the obvious improvements? Anyone
have any idea why the older version will run and the older version won't?

Thanks gang.

Just wondering, after reading some of the docs, do you have to have SDL
setup under MINT to be able to run PMDOOM? I'm not able to get the latest
release (.45) to work with the 4 meg shareware wad (its the only one I
have). It errors out with some complaint about not being able to use some
texture (blue something?).

Thanks everyone.

Check your SDMA clock or your F030 system clock.

Regards,

Didier.

Thanks for the reply Didier.

Well, it turned out I needed to copy all the *.SLB files back into the
Aniplayer folder itself. That stopped it from freezing up. Now it just
crashes. Odd thing is, v2.07 (shareware) plays okay without crashing.

HDDriver handles my 1GIG Jaz drive just fine. I amy just pop in and look at
the 2 GIG drives on Ebay. Oh, the Jaz drive ses carts not disks. Great piece
of work. I love mine.

Hello All,

Just wanted to tell everyone that I have successfully installed Debian Sarge
on my Hades060 using the CD-Rom method. Right now I do not have graphics, I
just have the consoles. I am trying to reconfigure the Xserver so as to bring
up the Gnome desktop. I also want to compile a new and updated kernel which is
something I have not done before, so it may take awhile. My network PCI card
is not recognized which is the biggest reason I want a new kernel.

Your WAD file is too old (1.2 version or older). Grab latest 1.9 shareware
version there: http://www.liberatedgames.org/game.php?game_id=9

No, juste rename your Doom.wad as Doom1.wad, and it will work fine.
I found it reading the doom faq on the web.

Regards,

Jean-Luc

Hi,
Thanks to all who responded.

If 512mb is the largest partition size I can have under TT TOS then that's fine, bigger than a ZIP drive anyway. Speaking of ZIP drives are there any benefits to using these instead of a Jaz (apart from the size)? Someone mentioned that they (jaz) are carts not disks? What's the difference? As I mentioned before, I've never seen a Jaz drive "in the flesh".

A MiNT installation is in the not too distant future... after I have something to backup the current setp :o)

Cheers for now.

Dave.

Anyone manage to get Golden Axe working with Backards 3 on a Falcon?
Spent ages today but had no joy.

On the subject of games is there a list on the net someplace that
shows which games will work on a TT or Falcon?

Dave.

>

Hi there, again!

Any ways I did a chimp open up and check on the FA-ST drive. The enclosure has no water damage inside, but it was a little dusty, so I did a quick de-dusting. (I'll do a more complete job soon when I complete take the enclosure apart to clean the outside, and get to the fan outlet to clean that completely.)

I didn't bother to disconnect and reconnect the cables at this time, but I did push them into both drives to see if maybe one of the cables was loose. They both seemed to be in pretty well. (When I disassemble it, I will of course be disconnecting both drives from everything...)

Anyways it turned out that both drive are Quantum LPSes although one says lightning on it. I think that it's a Quantum lightning lps365 IIRC. The other drive just says quantum lps and lists cylinder/heads/sectors for 3 different types of drive. I didn't really see anything on either drive to identify what size it was or that it was even SCSI for that matter. (Sheesh!)

Now, after doing that I think that I can hear the other drive trying to spin up, but it never makes it. As a matter of fact today it was doing that but seemed to lock the bus.

The LED for what I am guessing is supposed to be the 2nd drive would come on then never go off. The working drive would flicker on then off first, but when it was trying to boot, I'd get the first drive then hear, what I believe to be the second drive(should've left the cover loose!) the light never would go out, then I would get a sense error $FE {0,0} in the upper right hand corner. The desktop would show a C: drive but say that it wasn't available when access was attempted. Now the odd thing, a ctrl-alt-del will generally get me booted up with the working drive. (I still think that I can hear the second drive try for a while, then give up...)

...will work on that after cleaning up the rest, as at least worst case one drive works, the ICD adapter works, and I can get an adapter for one of my 2(or so)G drive for ~$15. (Still I'd like to get that software off of there... I wonder what happened to the original disks, and manuals as I'd guess it was all legit. }:)

> D-U-D-E!!!! STOP RIGHT THERE!!!!!! DO NOT USE ALCHOL!!!

Hi again!

Ok, took down the case today with the original intent to do the full job.

(Does anyone else think that Atari could, maybe, have fit in another 1000 screws or so somewhere? ;)

Anyways, got the plastic case top off. Disconnected the keyboard(is the keyboard cable supposed to be that easy to pull out?) Brushed off the keyboard with a dry toothbrush(just used a new one as I have a few extras ATM). Put that aside and decided to work on getting the shielding(RF mainly I presume) off.

Now I had a look at the internal damage. I would hazard, maybe that one or both MIDI ports are probably shot. the one closest to the back looks in pretty bad shape internally, while the other doesn't look all that bad. Now for the surprising part. Once I got the shielding off of the power supply and off the rest of the shielding, it looks like that was the ONLY part to have been affected by the water. Looked like the metal shielding worked for more than RF shielding.

At this point I ran into a REAL problem. the lower left(towards front, other side from mouse ports) the plastic post with the metal receptacle for the screw there is BROKEN off from the bottom plasic case. I tried to hold it in place with with a flat bladed screw driver, but that didn't work. I don't think that I have any needle nose pliers(couldn't find one) so that is out. My other idea for getting this was to clip the shield there in the corner so that I could get it off, then get the logic board out.

Anyone else have any better ideas regarding dealing with the broken posted screw?

(Yep, sure enough there were 4 1M SIMMs as expected, and the ROM chips were labeled MYF(IIRC) 2.06. Wasn't sure about the rest, and just intended to close back up until I had a way to get the logic board out.)

Did more quick dusting and debris removal(not much). Screwed everything back down and did a test powerup. (see other message regarding hard drive. Was going to do more, but it started raining, and I was tired of playing around with 10,000,000 screws holding everything together. Atari probably could have saved a couple more bucks by dropping about half of those screws! I figure that there are at least 26 screws on the keyboard to separate the logic board from the rest of the keyboard! nuts!) And, of course, the V key still did not work, but that'll have to wait for more time and better weather, as I plan to wash the plastics outside and let them dry out there, hopefully, in the sunlight... (Tuesday evening maybe...)

Oh yes, the floppy was an EPSON, but I didn't bother with the part # as I'd hazard that they are no longer available, but I'd like to know which FDC chip I have. (Was thinking of trying a 1.44M drive once everything is cleaned out.)

thanks
john

Guys, I just wanted to let everyone know that I lowered the reserve price on this item, and after some questions about shipping, I've decided that I will ship out of the US as long as the buyer understands that (in the end) they will be paying for that.

Honestly, I paid $275.00 for this machine, plus S&H, plus the work Mark did on it.

So I've actually got more than $300 in it. I'm not making a dime on it by selling it. I just thought that I could get (at least) my money back on it, and perhaps allow someone in the Atari community who didn't have a Falcon, to get one.

So much for all the talk I've been hearing about how much higher end Atari machines (STe, Mega STe, TTs and Falcons) are going for. Look at the current bid on this machine and the auction is very nearly over. :-(

Thanks everyone.

I found this:

    �     It should be possible to connect the D-Link DE 600 pocket adaptor
to the parallel port of a Falcon, because this one is bidirectional.
Although it is possible that the speed of the parallel port is limited.
����(thx Cedric Moreau)

So anybody who already try to use it with Falcon like that?

Hi Pawel!

PK>It should be possible to connect the D-Link DE 600 pocket adaptor to
PK>the parallel port of a Falcon, because this one is bidirectional.

All STs have bidirectional parallel ports. But the Falcon has got =
more of the handshake lines than older models had. These are ACKNLG =
and SLCT. Computers mostly have 25-pin connectors, as opposed to =
printers having 36-pin connectors. Therefore, the pin numbers are in =
some cases different.

PK>So anybody who already try to use it with Falcon like that?

I don't know if (even on the Falcon) all necessary lines are =
available. And even if so: I don't know of any driver for this =
combination.

I've got a Genius Ethernet adaptor hooked up to my Falcon using a rom-=
port interface from Elmar Hilgart.

With best regards
Ekkehard

P.S.: some information from Chips'n Chips by Michael Ruge, translation =
and additions by Ekkehard Flessa.

The Centronics interface, sometimes called parallel port,
transmits data on 8 parallel signal lines (plus some additional
handshake lines).

data transfer type:	8 Bit parallel

transfer rate: max. 1000 cps (???)
synchronisation: STROBE-Signal from computer
handshake: by ACKNLG- or BUSY-signal
signal voltage: TTL-compatible (0V/5V)
cable connector: 57-30360 from Amphenol
connector on printer side: 57-40360 from Amphenol

Pinout of the connectors (Delta-Ribbon type) und description of the signals:

S: Atari ST (according to german 520ST users manual)
F: Falcon (according to german Falcon users manual)

SF	Pin-Nr.	signal name	input or output on printer side	description
xx	1	STROBE	in	The STROBE-impulse triggers read-in of the data.
xx	2-9	Data 1-8	in	Incoming data are equal to bits 1-8 of a data byte that is sent to the printer.
-x	10	ACKNLG	out	After reception of a data word, this signal goes to 0V for approx. 10 Microseconds. The printer tells the computer that the data have arrived and it is ready for the next word.
xx	11	BUSY	out	Set to 0V to indicate that the pronter is ready to receive data. In case there's no paper or the printer is OFF-LINE, this line carries 5V.
--	12	PE	out	Carries 5V in case of paper empty.
-x	13	SLCT	out	Indicates whether the printer is in use. Falcon connector: Pin 17
--	14	AUTO FEED XT	in	If set to 0V, the printer will always append a line feed.
--	16	GND	out	logic ground.
--	17	CHASSIS-GND	out	ground from printer chassis.
xx	19-30	GND	out	ground for printer cable.
--	31	INIT	in	Reset line for printer. If set to 0V, the printer RAM will be erased.
--	32	ERROR	out	Will be 0V in case of paper empty or OFFLINE. N/C on Atari side.
--	33	GND	out	ground for printer cable.
--	35		out	High level (+5V) via a resistor from printer's power supply.
--	36	SLCT IN	in	Must be 0V to allow data reception for the printer. Set to 0V in the printer cable if other side is 25-pin.

```
   Pins 15, 18 and 34 are N/C.

I've read that you can bung stuck drives into the freezer for a couple
of hours, frees up stuck mechs long enough to suck the contents off.

Might be worth a drop or two of thin oil on the drive bearing if you
can see it.

You're better off asking at Atari Forum (www.atari-forum.com) as there's
more than a few enlightened game players on the site you can ask these
questions.

Umm, I made a feeble attempt to answer this at Atari Age, but basically what I said was try the time-honored tradition of raising it a couple of inches in the air and dropping it on a hard surface. If it works, then you'll eventually need to open it up and reseat all the socketed chips.

If it doesn't work, my best bet (and first guess actually) would be that your power supply is weak and you need a new one.

HTHs.

Thanks for the reply.

Well, I renamed it to "DOOM1.WAD" and the game doesn't complain about the texture anymore. It just crashes hard. :-(

Thanks for the reply.

Well, I downloaded that file. Copied the DOOM2.WAD file over so I have the following in the PMDOOM folder now:

DOOM.WAD
DOOM1.WAD
DOOM2.WAD

Running the game as "DOOM.PRG" or "DOOM.TTP" and passing it the WAD file to use as parameters results in an error and crash. The error from MINTSETT looks like this:

```
! pid 63 (doom): ILLEGAL
INSTRUCTION: User PC=10DBA2a
(basepage=1674000,
```

text=1674100, data=16ECF90,
bss=170BB30)

and it locks MINT up hard, requiring a manual reset or powerdown.

Now...I can use the "-audio off" option and it runs just fine. With no
sound. Which is not nearly as fun. :-)

I've got a Falcon 030 with the CT60 accelerator, running at 90mhz, with a
Wizztronics 14 meg ST RAM card, and a 256 meg SDRAM stick by Crucial in
the CT60. I've also got the motherboard mod.

Anyone have any ideas why trying to use sound causes the system to lockup
hard?

Thanks.

Didier, I'm a complete newbie when it comes to the CT60 'n stuff. I've no
idea how to do what you just said. If you could please tell me how?

BTW, I went back, turned sound off, and it plays the movies fine. Its
something thats going on whenever sound is accessed/used. I don't know if
that helps point in the right direction or not.

Thanks.

Your PSU is dying. The flickering is caused by a drop in voltage everytime
the floppy-drive move it's head.

I don't know about this, but erase it as well - or rename it as .wae,
this should prevent it to being used.

IIRC, it does the same on mine, with MagiC! 6.2.

You see the problem why asking for PPC as the next generation. ;-)

> I actually succeeded but I'm afraid you need even more than one whole
> day to convert a complete CD to mp3 on such hardware.

Yes, my small server (486) needs more than a day. This is not really a problem
because he can work for me if i am on work. But my other server (slow pentium)
can do it much faster. I can get the mp3 at the same evening.

Regards
Michael

I had the same problem with my brand-new 10040 in 1987. If it is caused
by poor regulation of the power supply, it might be fixed by additional
electrolytic capacitor between the +12V and GND lines. Another cause
might be larger voltage drops caused by high currents flowing through
the GND line. This might be fixed by providing a better, lower-restance
connection between PSU and disk drive GND pins.

Christian

It is wiser to replace failing electrolytics.

If their capacitance is decreasing, they are drying out and will eventually fail, possibly in a dangerous way (smoke, fire, shorting).

Have you stuck a meter on the rails around the board?

If it is dipping significantly, you know the power rail is to blame.

I cant think of anything else that connects video with floppy disc...

At one time, the only ethernet opition for an ST was the DL 600 ethernet adaptor. It needed a small circuit built, and probably connected to the cartridge port.

The file with all the information needed in it starts with the characters TUW, and may be found in the umich archive, when last I looked, and on one of the Ausgabe CDs. It comes with drivers for MiNT, which at the time was probably the quite compact KGMD.

I would also think that the Technical University of Whatever would have a copy.

If you have a D-Link, do not give up yet. You may need to learn German, or to make a GAL, but those things are possible.

Jim

What do you mean stick a meter around the rails?

ok I will see if I have another PS to try and report back!

Thanks everyone

Yes. I remember reading something about that years ago as well. I also seem to think that I recall leaving a drive out in the sun.

I'm not really sure that I believe either one though. I'll have to check around some before trying it, but I guess in a worst case situation it'd be better than nothing, but I'll wait until I get my adapter and setup one of the 2G drive as another external in case it does work and copy all of the stuff to the "new" drive...

It's possible on some drives to see an exposed drive bearing? (I've never heard of this at all...)

(At this point I'm possibly more inclined to believe that maybe the drive doesn't have a good connection as in the cables need to be reseated, or maybe that section of the cable is bad, but with SCSI I'd expect the whole drive chain not to work if that was the case. Anyways this evening I'll be working on it some more...)

I've used an old house brush before to dust them down. If that isn't enough I take the things apart so that you have just the outer case with nothing attached. You can give that a good wash with a bit of soapy water. It generally insn't recommended to use detergent, but I've never had a problem. I give the case a rinse and let it dry or use a hair drier to help.

If you fancy cleaning some stubborn marks try lighter fluid. This should remove quite a number of things without damaging the plastic.

Isopropyl may be OK but I've not found it very effective. It's OK for removing minor marks but it can dry the plastic and you'd need quite a lot of it to do an ST case.

> I'm also in need of some advice re: cleaning corrosion on cartidge port

> is definitely going to have to be cleaned off before any cartride would
> work.

You want to use something that isn't going course further damage. Very fine

wire wool would work but if you have bits of it left in there you could
damage the ST. I'd use some fine carborundum paper (400 or 600) . You can
stick a bit to a lolly stick or stiff bit of card so you can get it inside.
Don't overdo it ! You'll need to clean out the dust with a brush and you
could give it a wipe to pick up any remaining bits.

> V key is not registering. Any common problems with keyboards other than
> to try to clean it, hope for the best, then replace keyboard failing that?

Could be a bit of muck got in. St keyboards are a bit fiddly to take apart
and more difficult to assemble due to the little rubber caps that bounce
off. If you can get another keyboard it could save a lot of hassle to just
swap it.

> I also need to crack open the STe case and check out the internal
> conditions...

Why ? If it works OK leave it alone !

Bleach ? Why risk using bleach ? It isn't necessary. It is something that could damage the plastic so best avoided. Just the soapy water should do the job fine.

Ronald,

You should really check your CT60 installation. I think there are some test utilities for SCSI and SDMA in the CT2/CT60 archives. Also, I suggest you try some different SDRAM modules and some different PSUs.

Hi Peter. Thanks for the reply.

Does the fact that PMDOOM will play fine with the "-audio off" switch give any indication as to where to start?

I *should* have good hardware. I've got a new PSU, I'm using Crucial RAM in the CT60 and the Wizztronics 14 meg RAM card on the ST RAM side. I'm not getting any odd pixels or video garbage. No random crashes. The CPU is staying about 31 deg C. Its just the sound. Not all sound at that. I

can use Bobtracker, which uses the DSP to play MODs just fine, clear and
crisp.

Thanks.

It depends one what has stuck. On many "stuck drives" the heads have not
retracted properly or the head retaining latch has jammed. In the these
cases the data can some times be recovered by removing the top cover,
freeing the head arm, and the reading the data off. I have done this on a
coup,e of IDE drives on PC's

Dave.

Ronald,

Do you have something modifying your sound matrix? Poke around with
the sound .CPX (I can't recall if that is actually it's name) and see
what you come up with.

Galen

> I've used an old house brush before to dust them down. If that isn't enough I take the things apart so that you have just the outer case with nothing attached. You can give that a good wash with a bit of soapy water. It generally insn't recommended to use detergent, but I've never had a problem. I give the case a rinse and let it dry or use a hair drier to help.
>

Thanks. Took the top off again today and the keyboard out. Decided to go with a diluted solution of bleach and warm water, as I was worried about the origins of the water involved in the damage, plus whatever else had been done to it. So I got my trusty tooth brush a plastic cup, the upper half of the plastic case, scrubbed in inside and out, and let it dry. After this I grabbed the keyboard, took off the circuit board, put all the rubber cups to the side, then took the keyboard outside and applied the same treatment as the case. I let them dry for ~3hours outside, mostly in the sun, but it gets darker earlier now. They were mostly dry(case completely), and the keyboard as far as I could tell was dry, so I put the cups back on the keyboard(good tip re: the books as props) put the circuit board back out, connected keyboard, then put top half of case back on again.

Tested it out just now, and all the printable(or obvious modifier keys and tab/delete/etc) all work. The rest I am assuming work(e.g. function keys) as they give a speak pseudo-click sound when depressed. I'm pretty happy with the case cleaning job as it looks almost as good as new although not in quite the same condition as my 520.

> You want to use something that isn't going course further damage. Very fine wire wool would work but if you have bits of it left in there you

I noticed it was pretty cheap when I took the circuit board off.
Wonderful people those Tramiels, but I guess they really meant RBP!

>> I also need to crack open the STe case and check out the internal
>> conditions...
>
> Why ? If it works OK leave it alone !
>
I was/am concerned about how far the water damage spread.  Looks not too
bad, but I now need to work out a way to free that one last screw to get
the main shield off, then the logic board out.  I want to do the same
cleaning to the bottom half of the case, and do dust/debris removal as
necessary on the logic board.  Additionally, it'd probably make the
corrosion cleaning easier, esp. if I could get a ckt brd vice to put the
logic board in while working on it...

I had the problem with my brand-new 1040.

> If their capacitance is decreasing, they are drying out and will eventually
> fail, possibly in a dangerous way (smoke, fire, shorting).

New electrolytics have the advantage that they offer more capacitance as
  electrolytics manufactured ten or twenty years ago.

Ah, well, I just get that impression since your MiNT installation screws up and some other stuff (Aniplayer, PmDOOM) doesn't work properly.

PmDoom has sound problems on my machine too; in MiNT I can only use the 8-bit SDMA driver, and the sound is heavily distorted. Other stuff work fine though.

Have you boosted the mainboard?
Are you sure the SDMA clock is ok?

Some problems with the system may only appear when using certain applications..

> PmDoom has sound problems on my machine too; in MiNT I can only use the
> 8-bit SDMA driver, and the sound is heavily distorted. Other stuff work
> fine though.

Like most people, nobody read the README.SDL file that is present, that gives many infos about what SDL drivers are available depending on the OS and hardware you run it on, and where you can find this about audio drivers:

Audio	O/S	Misc
dma8	All	Uses MFP Timer A interrupt
xbios	TOS	Uses MFP Timer A interrupt
xbios	MiNT	Uses MiNT thread
xbios	Magic	Disabled
stfa	All	Uses MFP interrupt
mcsn	TOS	Uses MFP Timer A interrupt
mcsn	MiNT	Uses MiNT thread
mcsn	Magic	Disabled
gsxb	All	Uses GSXB callback

A standard falcon should have some problems trying to replay audio under Doom (8 mixed channels, 16 bits stereo sound) at least till a DSP driver is implemented. But it should be OK on CT60, provided that FastRam and caches are enabled.

About Magic: nobody volunteers to test audio under it before I release SDL 1.2.9, so I prefered to disable audio to be on safe side.

Well...I'm sorry that wasn't the correct solution. Although in the past
when I've had that happen, that was the cause. Any chance, (and I know its
a long one) that you've got *2* bad power supplies?

Er, my MINT installation doesn't screw up. I'm not sure where you got that
part at? It seems rock solid to me here.

> PmDoom has sound problems on my machine too; in MiNT I can only use the
> 8-bit SDMA driver, and the sound is heavily distorted. Other stuff work

>
> Have you boosted the mainboard?

Yes, I had Mark Ducksworth do it for me.

> Are you sure the SDMA clock is ok?

No idea. How do I go about checking it?

> Some problems with the system may only appear when using certain
> applications..

Right - and I can assume that it usually stems from a single problem, yes?

So right now - sound with DOOM = crash
               sound with Aniplayer = crash

               sound with Bobtracker - no problems

Not tried much else. Can you recommend some software to test that might
help narrow the problem down? Or some testing software?

Thank you very much! :-)

Well, try again without the boot.

> > Are you sure the SDMA clock is ok?
>
> No idea. How do I go about checking it?

Like I said before it's an hardware problem... SDMA clock is bad.
Your answer is here:
http://www.czuba-tech.com/CT60/english/Fitt_sold.htm
Some important part :

"Verify you see no 74F08 soldered (added) on the clock trace near the SDMA chip. If yes, you must remove this 74F08 and connect again the clock trace (that was cutted for this 74F08).
- If you see a component 74F08 or 74F04 on the GAL U63 (left of the NVRAM) with some wires connected on the resistor places R216, R217, R221 & R222, you must remove this component and the wires. Solder the three 33 ohms SMT resistors (furnished) on R216, R221 & R222 places.
- If you have no 74F08 or 04 on U63, you have to verify all the three resistors R216, R221 & R222 are well 33 ohms marked 330 or 33R). On some motherboards, one of them can be a 0 ohm (marked 0 or 0R0) : replace it with a 33 ohms. "

"Locate the SDMA (U36) under the floppy drive place. Locate the Clock trace arriving the the second pin from the left/rear corner (see the photo). Scratch the varnish (2 mm long) until you reach the metal, then tin it. Solder the 47 ohms (yellow, purple, black, gold) resistor (furnished) between the pin #14 of the AJAX chip (U20) and the clock trace like on the picture. The resistor must be closest to the SDMA and the pin soldered on the clock trace must be the shortest possible : it is termination resistor. "

"Some problems to solve (after you updated the ABE & SDR chips) :
- You hear some audio CRACs when running SDMATEST (2KB) at 50 KHz with 4
tracks. (http://www.czuba-tech.com/ct60/sdmatest.prg)
WORK AROUND : Solder a 27 pF capacitor parallel on the 47 ohms resistor
of the SDMA clock."

Regards,

Didier.

Well, I guess its like the man said, "never rains but it pours".

To the list of programs that won't work with sound on my CT60 Falcon (Aniplayer, Doom), add my floppy drive. I didn't have a reason to use it before, but it seems to be deader than heck. I mean the access light is coming on but nothing can be accessed. It worked before the CT60 install, so I'll have to check more on that.

The good news is, the SCSI subsystem seems to be working just fine. I backed up my C drive using CDISO (part of the CDWRITER stuff from Anodyne) at 4X on my Plextor CDRW and it worked great. Done in just a few minutes.

Always a silver lining if you look hard enough. :-)

Well, as Didier wrote, you should check your SDMA... your problem with
floppy might be solved by turning off �floppy background DMA access� or
whatsoever it is called under the OS you use.

Regards,

Jean-Luc

Okay. All I did was copy the 68020 file instead of the 68060 file into the Aniplayer folder and suddenly I've got working sound. I tried a couple of AVIs, one MOV, and one MPEG (the mpeg didn't work, said something about a bad block, but it did try without crashing).

I've not had a chance to try an OGG yet, I'll give that a shot here a little bit later. Does Aniplayer support MP3s?

So my next question is - since it works with 68020, but not with the 68060, even though I've got a CT60, does that mean I probably still do have problems with the SDMA clock?

Thanks everyone.

Yep coming soon. I just want to get X11 up and also the Gnome desktop. I tried something to get it working and wiped out something and Linux does not boot. I am installing it again now. Going smoothly like before.

Wht problems did you encounter when you tried to install Debian 2.1?

I am an ST user and game collector, and I have had some very bad luck. A batch of ST games I won on Ebay had mold on the disk surfaces, and completely destroyed the floppy drives on both of my ST computers. (moral of the story, look at the disk surfaces FIRST before loading any second hand games) The drives are toast! Beyond cleaning or repairing.

I would be interested in buying any internal DSDD floppy drives that someone out there might have as extras. I am only interested in original Atari ST internal drives. I am not interested in converted PC drives, as in my experience they are a little bit dodgy on some of the more heavily copy protected games.

I am completely bummed out that I have no functional STs to use. This is the first time I have been in this situation in over 10 years! And I just got a bunch of new ST games in the mail that I ordered a few weeks ago. This sucks!

I am not interested in paying the $75 - $125 prices that the remaining ST dealers are asking for reconditioned and new internal drives.

I would like a total of 4 DSDD internal drives, 2 to get my STs running again, and 2 more as replacements. If anyone has any internal drives, with clean well aligned heads in good working condition, please e-mail me at STcomp@cwo.com. I can never have too many. I can pay by PayPal.
Thanks. -STcomp

> Thanks. -STcomp
>

4 drives could be a big ask, seriously try a TEAC 1.44. I have used a few, never had a problem with any disks. They usually cost around $15(Australian) new. Be worth a try.

Mark

Thanks, I'll try that. As soon as I find that CPX. I don't have any CPX that has anything to do with sound in the CPX folder currently.

Hmm. Do you mean the one with the picture of the head that turns right and
left to reflect balance?

Thanks again.

Mike I just don't know. I had Mark Ducksworth do the work - he certainly
seems to know what he's doing so I can only suppose that he did it exactly
as Rodolphe has outlined.

Okay, about MP3 and OGG files.

I can play MP3 files just fine. Clear, sharp, and Aniplayer is reporting
about 10% usage. Is that about average guys?

Thats the good news. The bad news is, OGGs are unplayable so far. They
skip, stutter and carry on. Aniplayer is reporting something like 461%
usage. Ugh.

Same with MPEG, AVI, or MOV movies. Aniplayer is reporting something like

600 - 700% usage. Not good.

So the question I have to ask is this, does everyone still think that the
SDMA clock is the problem, considering I can play MP3s? Movies but very
slow, or movies at speed with sound turned off.

I appreciate any and all advice. Thanks! :-)

Hey, that's a cool idea.

A TFT with the right size, and a RGB/Composite/TV -> VGA adapter + some wires internally. You could even make it support all 3 resolutions if you're lucky.

I don't have a Stacy so I can't try it myself, unfortunately..

Dude,

Are you using the floppy cable from the mainboard? In that case, the drive won't work.
As described in the CT60 documentation, this cable shall be connected to the CT60 to provide 12V power to the mainboard. The floppy must be powered directly from the PSU.

Again, check your installation.

I I thought about that too :) It could be possible but the problem is to get
right TFT and cheap one :)

So then it should be possible since STACY got full ST VIDEO compatible
SHIFTER. But then I think it should have better POWER SUPPLY or more, better
batteries :)

Well I got 620 version, but the author describe it should work.

But im not sure about DRIVERs, theres one for STING for sure but the version exist is/was not 100% complete.

So maybe for MINT?

I just need info its worth to build adapter for D600 or due to not so good drivers its not worth a penny ;)

Hi, I'm Ben Smith here in Portland, Oregon USA! Proprietor of Bravo Sierra Computers! Occupying a unique niche in the Atari World! Most Atari Dealers sell NEW, I also sell Used Atari Goods! Not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you wont find at Swap Meets, Thrift Stores or Auction Sites! And I sell for less! Unlike those remaining anonymous! I test Goods before I sell them. Not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, because I'm the guy people goto to give Ataris a New Home! Saving Orphaned Atari's from Oblivion!Goto http://BensCatalogs.Atari.org or (503)256-9974!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or

Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Yes, I have it like that. The original floppy connector from the Falcons
motherboard goes directly to the CT60 (with correct red and blue
orientation).

The ATX power supply does run the floppy. Note that I can click on the
floppy drive "A" icon, the access light on the drive comes on, it acts
like its attempting to read the floppy, then Thing reports "unable to read
Track A", about 2 times in a row, then says it can't do it.

Thanks.

No, as you said, I'm going to have to open my case back up and see if I
can find something.

A little background: I was given a Mega STe a few years back but, being a Woz-worshipper, I never did much with it. The unit came without a keyboard and I remember spending a good portion of my lunch money on a new one. I fired it up a couple of times, poked around a bit and then left it to languish in the basement until late last night. At some point during those years of disuse, the keyboard apparently shuffled off this mortal coil.

Does anyone have any thoughts or simple troubleshooting tips? I have no intention of doing anything other than the most basic tasks (i.e., cleaning). Anything requiring a soldering iron, mucking about with firmware, etc. is right out.

I think the lasterjet 2 or laserjet 4 driver will work fine with this.

Thanks
David

Yes, it will work. I sometimes use a LaserJet 2200 (a bit newer than the
```

4050N) with my TT, and the drivers (NVDI, TempusWord) for the older LaserJets work fine, at least for 300 and 600 DPI.

```

Is the keyboard itself bad, or are you saying the coiled cable is toasted?

While we're on this subject, the HP 1160 and 1320 both support PCL5e.
As such, both are very likely to work with NVDI. The OkiData 4200 and
4300 series also have this support. Brother printers no longer do,
although they have FX emulation, which should work at least for text.
Finally, there's the Epson FX impact printers, which of course use FX
print language. They are loud, but should work fine with an Atari.

I remember that this was a known issue with some (early?) batches of 1040s. In order to solve the problem a modification on the motherboard was required.

I am very bad at German, but I believe that the following paragraph(s) describe the problem and the solution (text taken from Chips 'n Chips):

Bildschirmflimmern

Bei verschiedenen �lteren Systemen, kann nach einer gewissen Zeit ein Bildschirmflimmern auftreten. Dieser Fehler tritt in einem bestimmten Temperaturbereich auf. Beim Austauschen von Videoshifter und MMU wird dieser Bereich nur verschoben. Um Abhilfe zu schaffen, wird ein Kondensator im Wert von 5-10pf (Picofarad) an Pin 39 vom Videoshifter gegen Masse gel�tet.

Wer sagt mir, woher es kommt, da� bei Plattenzugriffen der graue Hintergrund des Monitorbildes leicht flackert ?
RESET-Signal am DMA-Ausgang �ber einen 7407 (kein LS!) mit 1 kOhm gegen 5 Volt verst�rken, dann treten diese Effekte nicht mehr auf.

Bei Flimmern, Grieseln oder Sternenbildung auf dem Schirm ?
An Pin 36 (16MHz out) des Videochips einen Kondensator von 10-120pF gegen Masse einl�ten. Der Wert mu� ausprobiert werden!

>> Umm, I made a feeble attempt to answer this at Atari Age, but basically what I said was try the time-honored tradition of raising it a couple of inches in the air and dropping it on a hard surface.

Plese don't do such a silly thing- it is likely to break more than it can fix. It is not the way to treat a piece of delicate electronic equiplemt- especially if it contains moving parts (such as the floppy drive) which do not suffer high accelerations lightly.

>> you'll eventually need to open it up and reseat all the socketed chips.

This is a much more sensible approach, possibly even for for preventive maintenance (though it will not fix the flicker problem)- indeed, due to thermal cycling, the chips are likely to slowly creep out of their sockets. Pressing them gently back into sockets may also scrape the oxidation from the pins, improve the contacts and cure some erratic behaviour. Dropping the computer from a certain height is supposed to press the chips into sockets too, but as the chips have fairly low mass, the deceleration would have to be very fierce (i.e. should be dropped from a great height to a very hard surface) in order to push the chps back into sockets.

I finally got it to work!!!!

I had to use a older Quantum 105s and removed every jumper. First time on it worked. After it worked I installed the terminators and started it back up and its still running.

So to everyone it can be done as long as you have the right drive. I wish it would have been a bigger drive but, it just wouldnt work..

Both drive IDs at ID0. the controller is used to select the ID.

Thanks

AO

Hi,

The software "Eureka" is updated and released on its WEB page.
It is a "2D Graph Describer and 3D Modeller". You will have to
fetch it at :

http://eureka.atari.org/eurka510.zip
That is the Complete Common Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Are Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny045.zip
Is the OpenGL Extension (requires previous package)

For this release, the 3D OpenGL rendering is enhanced.

I wish you big fun with all this new STuff !

Best regards,

-- Fran=E7ois LE COAT

Probably the keyboard, though I don't really have a way to check.  I
get no response from any keypresses, and the mouse cursor won't move.

- Mike

Hi,

Check out Lilliput, they might make a screen big enough, I know they do
little 8" screens that take in VGA and composite.

Is there a gem program that will run a macro?  Like opening up all of
my commonly used programs with one key stroke?
```

TIA

Well, if that guy doesn't want it, I'd be interested in the computer
itself, depending on what shipping is. Any rough ideas? I live in
Prestonsburg, KY, 41653.

Thanks!

I'll take that STiK source code!  The abacus books would be cool too.  Let
us know what he doesn't take.  Don't toss anything (yet).

Thanks,
Mark

Just wanted to add a followup - Mark Ducksworth was nice enough to type up
some info on the Falcon I'm selling, the one that he looked at. Here it is:
```

Hello,

I didn't actually do any soldering work the second time around but just pushed on the pins a bit. It seemed solid to me. Any oddities could have been a product of humidity or celestial alignment or you name it ;) The point is that this falcon is perfect with one possible exception, if you install something on the upgrade header and things behave oddly, you know where to look. If it gives you problems, there's one single pin (but not sure which one specifically) which should be hit with a soldering iron from the top (bad or pulled through-hole metal).

http://aoi.atari-source.com/~mduckworth/header.jpg - image is actually ctlink from rodolphe's site, just pretend it's the motherboard ;) If you know the falcon at all, you can tell which header we're speaking of from the image.

But as I said, it should be fine, and if it gives you trouble, just adjust the device plugged onto this header a tiny bit.

Thanks,
Mark

Thanks everyone.

Steve,

This comment is pure nostalgia - when I was trying to get STiK working, based on Flinny's package, I was having a terrible time with MTUs and such settings, until I discovered that your example settings were for the ISP that I was using - NetInfo - now just a memory.

Be aware that the computer would been a new power supply. 110V won't
get an STe expecting 240V very excited.

I promise not to TOS anything ;)

I'm pretty sure the latest sources are available
for download... Aren't they? It's been much
updated and improved since I stopped working
on it, so there's probably not much of interest
there unless you like historical bugs and limitations.

But, I'm happy to send it, if you're interested.
When I fire up the ST/e again to see if it still
works I'll copy it over to my PC.

Steve.

"David Leaver" <leaver@alphalink.com.au> wrote in message

> This comment is pure nostalgia - when I was trying to get STiK working, based on Flinny's package, I was having a terrible time with MTUs and such settings, until I discovered that your example settings were for the ISP that I was using - NetInfo - now just a memory.

Hi David,

That's a very good point about the power supply. A good reason for keeping it in Australia, perhaps ;) It's actually not the original power supply anyway. Soon after getting the ST/e I had it open and removed the metal cover from the power supply while it was turned on and managed to destroy it. The guy who fixed it only had an older 1040ST power supply, which has since had its capacitors replaced. Maybe it'll be good for another 5 or 10 years ;)

The original STiK was thrown together in a very short time in early 1995. In fact, the name meant Steve's Internet Kludge. I'm not surprised you had trouble with the settings. At the time I didn't know what standard values were widely used, and added config variables as I (thought I) needed them. But I was really writing it for myself until I realised that it would probably be useful for other people too.

I was living in Spence at the time. Were you in Canberra in 1995? We could have formed a user group! When I moved to Canberra in 1990 I stayed a member of ACE in Sydney but didn't have much luck contacting other Atari users in Canberra.

I owed money to Netinfo when I left Canberra,
and didn't pay them for about 6 or 8 months. I hope
I didn't contribute to their demise ;)

Steve.

I have a Atari Megafile 44 , it has the 2nd SCSI connector. Ive
connected a drive(Maxtor 7345SR) to the second connector and nothing.
Ive read every old message that I could find, checked web
sites(Vezz,Atariage and others). People look to have connected a drive
to the second connector and had no problems. I can connect the drive
by itself and see the maxtor no problem. I can connect the Syquest by
itself and no problem. I just cant get both of them to work together.

I have DIP switch 1-off 2-on 3-on
Ive tried the the Syquest on J2 and Maxtor on J3.
Syquest on J3 and maxtor on J2.
Both terminated, one on J2 terminated, one on J3 terminated.
Both IDs set at 0
Parity disabled on Maxtor

If anyone knows a site or just knows what I may be doing wrong please
let me know.

Vezzsweb site did have instructions saying it can be done but its not
clear(Italian). I looks to be more of rambling than anything,

Thanks,Don

It's a long time since I played with SCSI devices,
but...

    Each SCSI device in a chain should have
a *different* ID

    There should only be one terminator, at
the end of the chain.

Steve.

Hello,

As far as I remember, devices in the MF-44 must not be terminated, and you should be able to see them : I once used this adapter in a recased Mega-ST4, and both the Sysquest mechanic and a hard drive were running.

Hi, Guys!
So I bought N_AES, and I thought it could the problem I had with MyAES with Papyrus (locking menubar).
Well, actuallly it did, but now I have a problem with Photoline (go figure!)
Photoline can't render ANY image, not even the images it loads as brushes or colourpalettes.
With any other set I tried (MyAES, XAaes, TOS) it works.
It works even by launching MyAES on top of N_AES!

Any help?

Thanks!

I've no experience with the Megafile 44, but I do remember adapting a few Megafile 20s, 30s and 60s to use two drives (MFM or RLL, depending on size; LUN 0 and 1). Those were the days!

A question about your MF 44: are J2 and J3 connectors on the same cable? or two connection points on the host adapter?

If the latter, try to put the two drives on the SAME SCSI cable, i.e., one after the other. SCSI IDs must *ALWAYS* be different and the last one on the cable (furthest away from the host adapter) should be terminated - but not always! (We called this SCSI voodoo!)

If the former, your SCSI cable might not be good. Try one drive hooked up to J2; detect drive; turn off MF; unhook drive from J2 and hook it up to J3. Can you see the drive in both positions?

If still no joy, it's possible that Atari crippled the hardware to allow only one SCSI device on the chain. I don't know whether there is a utility to override this type of hardware setting.

Good luck!

Randy Kwak

"atarionly" (atarionly@adelphia.net) writes:

> I have a Atari Megafile 44 , it has the 2nd SCSI connector. Ive connected a drive(Maxtor 7345SR) to the second connector and nothing. Ive read every old message that I could find, checked web sites(Vezz,Atariage and others). People look to have connected a drive to the second connector and had no problems. I can connect the drive by itself and see the maxtor no problem. I can connect the Syquest by itself and no problem. I just cant get both of them to work together.

I don't know what causes this on your machine but on my machine
Photoline 2.30 works just great with N_AES 2.0.0 and XaAES 0.995, both
with MiNT kernel 1.16.3.

Can you give more details?

Back in the 90's, I had 2 Megafiles, the 30 and 60 meg varities hooked up
at the same time. Worked just fine on a Mega ST.

I've currently got a Link 2 that supports a 4 gig SCSI HD, Plextor SCSI
CDRW, and a Syquest SCSI EZ135. No problems at all. All have unique IDs
and I have a termination block on the last connection in the chain. Again,
on a Mega ST.

so weird!
let's see...
Falcon CT60@95MHz
nvdi5
centscreen
N_AES (+N_dialog)
Mint 1.16.3

If all of these SW are OK, I guess I am messing something in N_AES.cnf

By the way, I read about a patch for Photoline2.30 Is that true? What does it fix?

And by the way again, I have NO problems with the exact same setup but with MyAES, XaAES and TOS! I can even launch MyAES on the top of N-AES and have Photoline working!!!

The Mf 44 is not the same as the 20 30 or 60. Those had other adapters in them.

J2 and J3 are 2 connection points on the scsi adapter.

Everything I have read about putting a second drive into the MF44 says
to put them both on ID 0. I know the SCSI rules and from what I have
read in old post this adapter does not conform to the rules. It was
made buy Atari!!

Ive tried 3 scsi cables all work on my TT030. @ drives have been tried
and they work on my TTs internal SCSI.

Only the drive on J2 is seen. Yes I have the dip switch on one turned
off.

I don't remember the internal switch settings for handling 2 units, but
that makes only 8 possibilities, so it wouldn't take that much time to
find which applies, would it ?

Hi!

Let's try to clarify some points:

a> The Mf 44 is not the same as the 20 30 or 60. Those had other adapters
a> in them.

Right: Megafile 44 uses a SyQuest cartridge-drive, which is a SCSI unit, while the non-changable Megafiles have an adapter ACSI-RLL.

a> Everything I have read about putting a second drive into the MF44 says
a> to put them both on ID 0.

And the drives must each be connected on its own (i.e. J2 and J3 must be used).

a> Only the drive on J2 is seen. Yes I have the dip switch on one turned
a> off.

As far as I remember you have to modify the host adapter in order to use it for two devices.

I think this *might* help you: <http://atari.nvg.org/scsihost/>. Although the mod described there deals with a host adapter with only one SCSI plug, there may be something valuable for you. Anyway it would be helpful to know the part number of the host adapter (for web research...).

Regards,

Alexander

I found that site too. The dip switch settings for the mega STE and
stacy look to be the same as the MF44. The part number is :C103310
Rev.2 = ST to SCSI Adaptor (PCB).

found another site with info on dips and the part number is the same as
mine.

a> found another site with info on dips and the part number is the same as
a> mine.

I think now I found the same one - that seems to be an extract of Michael

Ruge's Chips'n Chips. Maybe you have a look at it directly - or at Robert Schaffner's doit archives.

Regards,

Alexander

Hi, I'm Ben Smith here in Portland, Oregon USA! Proprietor of Bravo Sierra Computers! Occupying a unique niche in the Atari World! Most Atari Dealers sell NEW, I also sell Used Atari Goods! Not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you wont find at Swap Meets, Thrift Stores or Auction Sites! And I sell for less! Unlike those remaining anonymous! I test Goods before I sell them. Not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, because I'm the guy people goto to give Ataris a New Home! Saving Orphaned Atari's from Oblivion!Goto http://BensCatalogs.Atari.org or (503)256-9974!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or

Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

To me it looks ok. About n_aes.cnf I really don't know what could
possibly go wrong. I see no reason why n_aes.cnf would be the culprit.
Anyway feel free to send your n_aes.cnf to me.

AFAIK, the patch is only needed if you want to use Photoline 2.30
under MagicMac.

I really have no clue. Which version are you using? I use the TT030
version. On my Hades Photoline always has worked be it under N_AES or
XaAES. I don't know if it works under TOS as I haven't been using TOS
since 1995.

Ok, I think I sorted it...
Photoline works perfectly in 16 or True colours.
that meand that there is something wrong in the way Photoline exchanges
images data with N_AES when in 256 colour mode.
Unfortunately, my current video setup is 640x408@256 @80-ish Hz.
My TC setup is only 608x608 (yeah, weird) and I don't have enough space.
Strangely I can't have hi Hertz in 16 colour mode (it ranges in the 50) with
hi resolutions, and frankly I am not interested, either.

So, is there a way-out before Nature starts producing SuperVidel? ;-)

1 Gb models work great, you can make a 1 Gb partition and enjoy...
note that 2 Gb models are not so very stable ;)

Hi Don,

A>I have terminated the end and tried no temination. No change. I can
A>get the drives to seen but only one at a time. Never together. I have
A>eveen tried different IDs and no change.
what hard disk driver are you using? Some drivers need to `know'
whether an ID is used or not.

I mean some drivers offer to switch hooked drives on and off. An
off-switched drive will be 'known' to the driver but you will never
see its partitions on the desktop.

I suggest you terminate the adaptor itself and the second (last, LUN1)
unit, and unterminate (sorry!) the first unit (LUN0). And give a try
to IDCHECK or something like that (e.g. HDDRUTIL may do that job).

Some ten years ago (during my ST times), I sometimes hooked up to 6 or
7 drives to my 1040 ST, some ACSI adaptors with one or even two
logical units.

Pleas give us more information about your drive. Is it really an
original Megafile44 (by Atari). And of what type is your computer? For
STE Computers will not 'play' with a second ACSI device. Atari saved
some pennies by producing those adaptors...

Don't give up hope too early. I'm sure your problem is to be solved.
What happens if you hook the Maxtor the Syquest being switched off?

Und TTsch�

If you're talking about the Falcon I have for sale, none. I'd like to offer some, to make the deal sweeter, but since I'm keeping one Falcon I'm keeping my Falcon software.

Sorry!

Uh,

I may be way off base here, but it's the DaynaPort SCSI Ethernet Adapter
and only specific kinds. And I have one of those specific kinds and never
got it to work. EtherNEC or better, CTlink is your best bet.

Thanks,
Mark

Well, not exactly :)

I think its not a DAYNA unfortunetly, Dayna should be easy to install since we have drivers from ANODYNE.

My D-LINK is a DE-620CT.

CTLink is not ready, and ETHERNEC maybe is ok but something is wrong and it wont work, and even its a not so good, cable for ROM EXPANDER, big ISA card... I preffer little nice things :)

Hello all.
Does any one know if there is any way to reduce the very high levels of
noise on the stereo outs on both the TT and STE. Could a change of power
supply help or perhaps extra shielding (probably unlikely) or is there no
solution. Strangely the audio output from the STEs monitor jack seems
quieter but
obviously in mono.

Thanks in advance.

I'm not having much luck tracking down this error code, but
a harddrive in an ICD FA-ST drive enclosure is returning:
error:  sense $04

Does anyone have any ideas what this is?
(ICD utils report it as an Adaptec 5500.  I haven't had a chance to crack
open the drive case and check out the mechanism yet though...)

What do people use to clean St cases?

Would isopropyl alcohol 50% abv be ok, or would it a) attack the plastics or b) should I purchase a higher alcohol content?

I'm also in need of some advice re: cleaning corrosion on cartidge port spring "pins". The pins look ok, it's just that there is corrosion that is definitely going to have to be cleaned off before any cartride would work.

V key is not registering. Any common problems with keyboards other than to try to clean it, hope for the best, then replace keyboard failing that?

I also need to crack open the STe case and check out the internal conditions...

(Yes, this is that STe that I bid on (and won!! }:) on ebay last week. It was in about the shape that I figure, it DOES work has 4M and TOS 2.06(apparently, although the seller listed it as 2.05 Teradesk says 2.06.)

The floppy drives on the STe are QUIET. My hopes were somewhat dashed when I looked at the STe language disk and it mentioned copyright omikron and I thought that I had gotten omikron basic. No such luck just plain old junky ST BASIC, although I think a newer version than what came with my 520ST although I don't think that it's any better from what I've read. (And I'm not really interested in BASIC anyways, but...)

AFAIK, Rory still is. I bought mine from him a few months ago. Something
like $70-80 or so.

I was reading an article on, myatari(or one of the other online mags that is still kicking) about a guy who had a Mega STe2. He mentioned that he always had problems with sound and finally found out c. 2000 about replacing one of the socketed chips with an older version that cleared up his sound problems in the Mega. IIRC the article was written c. 2002, and it should be readily apparent. (The guy was Chinese, but I've forgotten his name...ah Shiuming Lai... looking for the article...)

found it:
http://www.myatari.net/issues/sep2002/megaste.htm

I think its towards the end of the article. Actually it was on the third page, and here's the relevant quote:
"2000: Goodbye Snap, Crackle and Pop

This naughty chip on the right was mercilessly extracted from its cosy PLCC socket in February. While at university I'd gathered from some obscure Usenet postings that it could be the culprit behind my wobbly graphics and crackling sound. The solution was allegedly the older video shifter, part C300588. I tracked one down, popped it in and instantly cured the seven-and-a-half year bane of my STE enjoyment. No more envying 520 and 1040STE owners, I could have my cake and eat it. Of all the Mega STEs I've ever looked inside there was the C300588, it was just like me to get the lemon, no wonder nobody seemed to have a clue what I was talking about when I described the problems it caused."(Mega STE Love by Shiuming Lai)

HTH as in you problem wasn't just noise...

Hi,
I found a list of sense codes. These were in the documentation for some SCSI Tape drive access code called TapeBIOS by a guy named Alan Hourihane.

His code was for accessing Tape devices, but most sense codes should generally mean the same thing on different devices.

Steve.

Sense Key (0-7) Descriptions

Sense Key	Description
0H	NO SENSE. Indicates that there is no specific Sense Key information to be reported. This would be the case for a successful command or a command checked because of Filemark, EOM or ILI bits being set to one.
1H	RECOVERED ERROR. Indicates that the last command completed successfully with some recovery action performed by the target.
2H	NOT READY. Indicates that the Tape Drive addressed cannot be accessed. Operator intervention may be required to correct this condition.

3H MEDIUM ERROR. Indicates that the target detected a non-recovered error condition which was probably caused by a flaw in the medium or an error in the recorded data.

4H HARDWARE ERROR. Indicates that the target detected a non-recoverable hardware failure (for example, controller failure, device failure, parity error, etc.) while performing the commandor during a self test.

5H ILLEGAL REQUEST. Indicates that there was an Illegal parameter in the Command Descriptor Block or in the additional parameters supplied as data for some commands (Set Mode, etc.).

6H UNIT ATTENTION. Indicates that the Tape Drive may have been taken off line or the TAPE CONTROLLER reset (by BUS DEVICE RESET message or "Hard" Reset Condition or by CLEAR DRIVE command) since the last command was issued to the Logical Unit. This Sense Key is reported the first time that any command is issued after the condition is detected and the requested command is not performed. The UNIT ATTENTION Sense Key is reported to all Initiators which subsequently issue a command to the TAPE CONTROLLER. This Sense Key is cleared for the next command from the same initiator.

7H DATA PROTECT. Indicates that a command which writes to the tape was prevented by the absense of a write enable ring. The write operation is not performed.

8H BLANK CHECK. Indicates that a read operation timed out without finding data.

9H VENDOR UNIQUE. Provided by SCSI to report vendor unique conditions.

AH COPY ABORTED. Generally not used.

BH ABORTED COMMAND. Indicates that the target aborted the command. The initiator may be able to recover by trying the command again.

CH EQUAL. not used.

DH VOLUME OVERFLOW. Indicates that the tape drive has reached the End of Tape and data remains in the buffer which has not been written to the tape. A Recover Buffered Data command may be issued to read the unwritten data from the buffer. (set only when PEOT is set in MODE SELECT command)

EH   MISCOMPARE. not used.

FH   This Sense Key is RESERVED.

Thanks for the response. I was afraid that, that was one of the more
serious error codes, still I'll have to open up the enclosure and check
out the connections. The other drive seems to be running well for now

though, although looking at the partition names from the "dead" drive I'll
probably miss some of that stuff...

(Now to find some high-density D connector to the generic 50 pin converter
as, unfortunately all of my unused SCSI drives have those(high density)...
grr... and/or are SCSI-2/3 or ultra... sigh... and of course my
other(pretty new) external enclosure only has the old(!!) 50 pin connector
as well...)

Okay, I've got my CT60'ed Falcon back together and running again.

But...(why does there always have to be a "but"?)...I can't seem to get
```

Aniplayer working right.

I grabbed v2.22 from Didiers' web site, extracted it, ran the setup app, it picked C for everything so I just let it have its way. It stuck a couple of programs in the AUTO folder and some other stuff in the root of C. I copied the English stuff over so I could read it, etc, etc,...

Tried to play an OGG. Pallette on the desktop background lose most of its color and the mouse pointer freezes. Everything freezes, requiring a hard powerdown (manual switch off) and rebooting. Its much faster going through the fsck check with my CT60 but thats not really why I got it. :-)

Same with an MPEG.

Ditto with an AVI.

Ditto with a MOV.

Can anyone point me to a install guide or perhaps tell me what I'm doing wrong? I ran Aniplayer with my old Nemesis Falcon years ago and I never had any trouble. Very solid program, so I'm assuming its me.

Thanks everyone.

After finding out, quite accidentally, that baby wipes[0] are good for cleaning all sorts of things, I use them for cleaning keyboards and the like. You will, of course, need to make sure either you've removed the motherboard from the case or disconnect it from the power before giving it a clean.

>I'm also in need of some advice re: cleaning corrosion on cartidge port
>spring "pins". The pins look ok, it's just that there is corrosion that
>is definitely going to have to be cleaned off before any cartride would
>work.

No idea. Never had this problem.

>V key is not registering. Any common problems with keyboards other than
>to try to clean it, hope for the best, then replace keyboard failing that?

Other than the problems with the very stupid position of the mouse/joystick ports making them prone to failure if you don't use joystick extenders? As luck would have it, that's easily solved with a touch from a soldering iron.

As for the failure of the 'V' key, that's probably because a small amount of dirt has found its way in between the contact of the rubber cup and the traces on the keyboard PCB. Just strip the keyboard down and removed any debris that's on either the cups or the board.

You'll find you need to remove somewhere in the region of 20 small screws to undo and watch for cups stuck to the PCB when you separate the board from the plastic top. Also, note that there's one less cup than places for them, the missing cup being the upper one of the return key.

Re-assembly of the keyboard is easier if you place the edges of the top on a couple of books, or similar, so the keys are not resting on any surface. That way the rubber cups stay in place and it makes it a little easier to place the PCB back in place and screw it back together.

BTW, when you do strip the keyboard, it's a good idea to retouch the mouse/joystick connectors even if they haven't failed. Apart from anything else, it means that if they were going to fail, you'll have prevented it for a while longer.

[0] The fragrance-free varieties are the ones I prefer. I don't really want my keyboards smelling like a freshly cleaned baby.

Regards,
  David Bolt

Guys, is there anything that needs to be adjusted to let telnet work with STing? I've got Rorys EtherNEC on the Mega ST running my BBS, and I can't telnet *in* at all - I always get a "connection refused".

I can use CAB to access the 'Net with no problems. I can ping out, and from other comp

-- s on the LAN I can ping the Mega ST. So thats working.

Any ideas? Thanks.

No, assuming your BBS is written to use STinG for tcp/ip connections.

You may use TUR_GEM to check if your BBS application is really listening for incoming Telnet connections.

Get it from:
http://obooklage.free.fr/Atari/index.htm

: http://www.againsttcpa.com | In 2002 began the war for digital freedom

Nope, happened again, and it was not the kernel. (bottom posting looks silly on a large monitor) My external drive announced itself as HP 9*CB A 80)S1A0 instead of the normal HP 9.10GB A 80-S1A0S1A0, and did not read.

I rebooted in single TOS using HDDRIVER.PRG, again and again, until I saw the right ID, and then booted into MiNT, which is working fine right now. Hddriver, several times, read the correct ID on a bus scan, and not on booting.

I did wiggle connectors, and will probably hear about terminations, but now suspect the drive has a bit of a problem. It has been happy for quite a long time, and that is unusual for me. And, this connection is with pppd, so MiNT is happy and well.

Egale found two copies of the kernel identical, so apologies are in order.

So something is flaky, and the drive is the strongest suspect.

Thanks, I downloaded it. Any chance you can give me a "down and dirty"
most used list of commands? Most of that site seems to be in another
language and unfortunately, my language skills are sub-par. :-(

The connector or the cables are most likely responsible. Looks as if at
least 1 bit on the bus was corrupted during the data transfer.

  One point maybe: Our OS-es (TOS, MiNT, Magic) are not BETA ;) Real stuff, so
so far there indeed is incerdibile difference: we can use our OS-es! ;))

> Have you been to his website lately?

I have. All of the web pointers for this FAQ point to a site with a guy
who appears to have the same name, but zero about Atari on the page.
(Actually looks like an "I Love Me" site trying to support his tech
creds, which apparently don't look so good...)

> I'm having problems finding it on the 'Net. I found the

>

Hey, I found that one too! (Although at the time I was searching for
something else and got an English part first.)

Didn't anyone ever download or otherwise save a more recent version from
the "maintainer"'s site? In the future it may be wise to archive it

somewhere, i.e. maybe one or two of the Atari sites could setup a CVS or subversion repo, then encourage documenters to save duplicate copies there as well as on official sites. (A sourceforge project may also work for this, but I'd think that an Atari site would be better... fewer restrictions on content...) Actually, I'd think that pretty much all of the existing Atari documentation probably should also be dumped into such a repository... esp. various tech manuals, hacks, etc.

Yeah, this is exactly what happened to me. I am working on re-intalling it. Strange things keep happening when I try and run Mint. My Mint.CNF file and other files on my TOS partition in my Mint folder are messed up after I try

and boot it. I boot Mint many time and now this.

Actually Galen I heard the amount made was somewhere around 2000, but that is still a small number. Too bad someone cannot buy the rights and make some. I would think many would like to own a copy. I wonder what happend to T-Bird?

Oh Yeah. Thanks for reminding me. I do have Calamus SL 2003, but do not have
the Calipso module. I am meaning to get it though.

Yes, not pleasant. But u can not blame MiNT for that. If anything mess your boot partition is prolly bad drive, tosfs (FAT) related problem (like fragmenting etc), still if it happens oddly and randomly after clean reboot, its most likely drive/cables problem.. in some 10y those probs were responsible for mine MiNT related probs, i still use minixfs partition on TT, created in 96 though :) I think you both have something fishy going on... Check drive/cables!

AFAIK, this is not a MiNT problem. As said in a previous message I'm using MiNT since 1995, first on TT and now on Hades. In all these years and despite I've been using (and still using) beta version of all kind of programs - MiNT and XaAES included - I never have lost any data or got corrupted partitions. To be honest long time ago one partition got messed up from time to time but this was caused by Newsie (log file). But since the day I stopped using Newsie I never got any corrupted partition again.

The boot drive (partition C in my case) is the only drive which uses the old TOS format. All my other partitions are NEWFATFS with VFAT enabled or ext2fs.

You must search the cause of your problem somewhere else. Maybe MagiC does something weird with your boot partition, who knows.
One thing I'm pretty sure off, **MiNT is not the culprit**.

TTFN
Martin

Need some info on the Panther Graphics Card/Adapter.

If someone has one of these, contact me as I need some info.

Or if someone knows of a Review or related Info Online, post the

URL or etc.

Thanks,

phantomm@bellsouth.net

Had a look at Eiffel but the picture suggests that it needs to be
plugged into the ST/Falcon motherboard(not mention of TT). Is there
no wholly external solution?

Dave.

It's a very small wire only adapter to adapt that motherboard connector
to the TT's phone jack style connector.  I built one of these to connect a
Mega ST keyboard to my falcon.  Nothing to it.   I'm sure if you have
someone build an eiffel for you, they can put on the appropriate
connector.  The QWERTYX has this connector already but only supports AT
style keyboards (SOME ps2 with adapter) and only serial mice, so this day
in age it's pretty useless.  Plus it's not compatible with CT60.  And,
good luck getting ahold of one.  I can assure you that for your needs, the
Eiffel is your very best option.

Thanks,
Mark

The atari machines are getting quite rare in the US. With musicians picking them up for the YM chips and nostalgia people for games, their value is skyrocketing. A 4 meg, 16MHz STe of any variant really is worth almost as much as a falcon anymore. Mega STe's don't fetch as much comparatively.

I've found that people are willing to pay a substantial premium for a machine that is *complete*. As in MagiC, NVDI, Extendos, and all the other useful utils, Monitor, hdd, pre-setup, etc. Such a machine is worth a lot to someone who doesn't want to bother - and the atari community is FULL of people who don't want to bother.

If the day every comes that I sell my falcon - fully setup with CT60, I
can't imagine it'll go for less than $1000, that is unless people start
selling them.

$200 should get you a nice machine with hdd, 4megs, etc.

Remember too, the Amigas were arguably more popular. I don't know if
there's more of them out there or not, but I hear a lot of stories about
people trashing Atari ST's. There's simply not a ton of them around now.
Look on ebay... hardly ANY for sale. It wasn't that way just a couple
years ago.

Thanks,
Mark

I've had these nasty problems on Atari and it was all related to machine.
my 520ST and Mega ST were completely bugged. As soon as I got my Mega
STe, all these problems stopped with same disk and Link2. Then TT and
falcon are ROCK solid and never get even slight disk corruption despite
repeated improper shutdowns and crashes while I code ;)

Thanks,
Mark

> IMHO, the basic chipset does not stack up against a Falcon. I owned an A1200 as well - not as good a machine as the Falcon, again, IMO. :-)

yeah, but the a1200 is WAY easier to work with and expand. PCMCIA(solve my net connectivity for, well, essentially, free) builtin IDE, powerpc upgrades(kind of kills the reason why I'd buy it though...), FAR more common even in the US(apparently)....

Yes, if I had sufficient excess funds I'd be hunting TT/falcon/hades/etc. even(hah!) overseas ones, but I don't, hence the STe. I sort of know what a souped of falcon would be like via ARAnyM + xa-my-aes which is VERY nice.

Side note re ebay: I see that the guy that I was bidding against has been sucking up alot of Atari & Amiga stuff over the last several months, as well as some strange purchases of basic programming texts which aren't going to apply to either system even with their most "up-to-date" OSes. (Actually looks like he may even have let me win the STe auction, esp. considering he paid $255 for a basic Mega ST4, while he paid $71 for an accelerated one a few weeks ago?! "Dealer"? I've always investigated tenacious opponent bidders from my sniping(extemely numerous) losses... but thats ok as I *USUALLY* just do the max bid thing, and suffer the consequences... sigh...)

...and erm, if anyone has a spare, oh say, ICD Link97(or EtherNEC or both? or a copy of MAGIC or GENEVA(plus Neodesk 3+... have 2.02(and v1) myself already...) or so they want to sell for, er, well, a low price... }:)

Some day, I'll pay the hurt price and end up with a Falcon, preferably pre-pimped out...but I still want an Amiga a1200 as well, if for nothing else than the engineers who made the original Atari 8bit with all the extra support chips also designed the original Amigas, even if the OS looks (and acts) like something a band of wild chimps made...

Well, I was lucky and snagged what I hope to be a working 1040STe as Mega STe's look to be not on the market in the U.S.

In theory had minor water damage, but seller claims it works and boot. i.e. should be fine as it must have been allowed to dry, but I'll have to check for corrosion. Also supposedly is 4M and TOS 2.05(wow, a pretty modern TOS), and a Fast ICD hd(now have to find where I put those old drives and whether or not they'll need adapters...).

Also, at the same time I saw another odd entry on ebay ended around the same time as the STe: A Mega ST4, whose seller claimed a 4096 color palette yet only having the YM-XXXX sound chip, and a 30M Atari hd. The thing went for $255! (Don't some of the dealers sell for less than this? And it makes me afraid of what a Mega STe would go for, let alone a TT or Falcon...) I'd bet that shipping on it was c. $50 as well...

Just as a counterpoint two a1200s went for: $102.87(pretty much a basic system with hd), and a second NICE one with a 030 upgrade and IIRC 10M(and a bunch of other little nifty upgrades)went for $120 from the original owner. (The commentary on the item even sounded like the original owner, as opposed to the others...) Now compare this to a guy selling an a600 for $150 base model on the c.s.a.marketplace group...(Amigas must be more common in the US, as frankly all of these systems are pretty much comparable to the TT or Falcon... and <ducking> better with the custom support chips... Too bad the Tramiels were too cheap to keep the Atari R&D group to finish og little things like Amy and some of the other custom chipsets...)

They actually can not make a CD version.
Or, at least, ther are not willing to.

They developed the game with Cartridge in mind, and they stated it would be
a complete rewrite to make it for CD.
Then, they also lost interest in Jag, I think mainly because of their own
real life, and also because they have been flamebait-magnets in the jag
community for lots of misunderstandings, and also for TBird's attitude IMO
:-)

Funny to read this. My ARM-powered machine will batch convert a CD to MP3
(with -abr 160) at about 0.18 play/encoding time ratio, but this is under
Lame. So converting a 1 hour album would last 5 hours. All that achieved with
a FPU-less CPU (200 MHz, no DSP) !

I know BladeEnc is much slower (and reputed to be lower quality) than Lame.
It'd be interesting to know what Lame can do on your hardware.

Improvise. Video repair shops etc. Or failing that, a nice bright
yellow carefully selected elastic band.

Not sure how to help on originals. This world is obsessed with selling
you something new that doesn't quite do the job, and charging you for
spending your own money.

IMHO, the basic chipset does not stack up against a Falcon. I owned an
A1200 as well - not as good a machine as the Falcon, again, IMO. :-)

Hello again,

I'm thinking of using a standard PS2 mouse & PC keyboard through a
manual KVM on my TT. I've seen on Ebay (PeST) a way of plugging a PS2
mouse into the normal Atari mouse port but if I get rid of the TT
keyboard where do I plug the mouse in? Is it possible to use a PC
keyboard on a TT?

Anyone out there using this kind of setip?

Thanks in advance
     Dave.

You can use Eiffel interface to connect both ps2 mouse and keyboard.

Improvise? I live not un-near some places that sell bearings and o-rings.

There has yet to be a time there was not an 0-ring that would serve
as a drive belt, although I might have to buy five of them.

Top posted.

Jim

You can't control the keyboard externally, effile connects to the MB KB
connector. I would assume effile works with any Atari which uses the same
KB.

PeST is a external solution for mouse only.

Chris

I live in Brisbane, Australia and I haven't turned
my ST/e on for a few years now, so I guess
it's time to get rid of it.

I have an ST/e for anyone who wants to
come and pick it up.

It has 4MB of ram,
16MHz adspeed upgrade,
DTP Software
GCR
QIC150 tape drive and lots of tapes
300 Mb SCSI drive

It also has the original STiK source code,
though I guess that's changed a lot since
I last did any work on it ;)

Steve.

If your external monitor is VGA, it probably doesnt
have a speaker. VGA doesnt include the wires.

oops, forgot to add:

Something I was thinking of after I won the 1040STe(and looking at the Amigas), the seller should have broken it up into separate parts, i.e. hdd, 1040STe, Monitor, etc. He'd probably have gotten more total for the system that way.

(I learned all about this in the Apple2 groups. Apparently the base computer units are virtually worthless, but the RAM cards, drive cards, drives, etc. can be worth a significant amount of money if sold individually. Apparently my IIgs is worth about $15, but the cards, drives & manuals I have are probably worth $800 or so... I saw a dealer was selling the manual for one of my cards for $80!!! No card, just the manual! Also this manual is available online, although it took me a while to find it, and then the next day, I found my manual! :) Memory is fairly cheap for the GS though, although the only card still being made is only 4M but it is $49, drive controllers are like ST ones, ~$130 for new ones and the only one being made is just a compact flash "drive".)

Any chance you'd ship it world-wide? Taker pays shipping of course! :-)

I'm hosting (for approx 1 week) a torrent file containing a packed ISO of nothing but Atari ST soure code, music rips plus a complete collection of POV (Persistence of Vision) demo compilations (a lot of them with the appropriate source code to that menu).

A worthy collection indeed.

Visit: http://www.atari-forum.com/viewtopic.php?t=7031 for more information ...

Or jump straight to: http://www.mininova.org/tor/113912 for the torrent file.

Being hosted on a WinPC running Bit Comet but you can use any torrent leeching program to grab it.

Have fun!

Hello Mark.
Might give it Eiffel a look,I've seen someone selling them for �40 on
the internet, not a bad price really. The reason I'm slightly
reluctant to open up the case is that I once killed a perfectly good
ST when trying to add more memory - not the best person with circuit
boards and wires.

Might get PeST for my Falcon though as I only want to use a PC mouse
with that, the Falcon keyboard is just fine.

Cheers
Dave.

Eiffel would technically work in place of a Mega / Mega STE / TT keyboard. The pins on the external keyboard ports are identical to those inside of the STFMs.

Hence a TT keyboard working through this little port on an STFM; http://www.retro.dial.pipex.com/stram/images/image4.jpg The TT keyboard was one from eBay with it's plug cut off so I put a 4-way 3.5mm jack on the end.

No reason why the Eiffel shouldn't work in this setup.

Hi all,

Whilst looking on Ebay for a SCSI 250mb zip drive for my TT I noticed that there are rather a lot of 1gb or 2gb Jaz drives for sale at fairly good prices.

The specs on Imogea.com look good in so far as the transfer rates etc
but never having actually "seen one in the flesh" I wondered how they
perform on Ataris.

What size partitions can HDDriver create on one disk? Is a Jaz drive
simply just a really big zip drive?

Dave.

I have a SCSI ZIP and 2 SCSI JAZ drives.
All of them I found on a PC fleece marked.
Together 50 EUR.

They all work fine on my TT.

> What size partitions can HDDriver create on one disk? Is a Jaz drive
> simply just a really big zip drive?
>

It is not HDDriver that determines available partition sizes,
but OS (TOS, Magic or MINT) and the filesystem.

FAT32, ext2 or Minix: large enough.
TOS FAT: dependant of TOS version.

These maximums are mentioned on this platform many times
and I seem to be unable to remember them.

I have 1 JAZ medium for TOS 3.06 with 4 256Mb partitions that works.
The other media are 1 partition of 1Gb that I use with MiNT.

I only use the media for backup, not for heavy duty.

I am a lucky guy;
The day before my hard disc finally gave up I'd made a full backup
on the JAZ :-)

On my TOS 1.62 Atari STe, I'm using a 512Mb partition PC compatible (the
maximum IIRC). Pretty useful to transfer datas.

> I only use the media for backup, not for heavy duty.

Be carfuel, Jaz cartidges are famous for having problems when aging. An,
more specifically, the DRIVES are aging and can damage ALL your
cartridges before you realise what happens. I've had this problem
once... And now I'm backuping my Jaz cartridges ;)

Simon

You certainly are! According to Murphys' Law, its usually the day before
you were planning to make backups that the HD fails.

PS You know Murphys' Law - the one that states "anything that can go
wrong, will go wrong". It also has several subsets and sub-clauses that
covers everything the first part didn't. <grin>

Yes, I know.
Murphys law is a peoples explanation of entropy.

There is also the 'Peters principle' which states that in a company
everyone will carreer into a position where his capabilities and
competence become insufficient.

This principle is a peoples explanation of 'catastrophic collapse'
which is the scientific explanation for landslides and avalanches.

All young children learn the principle when they let dry sand
flow between their fingers on the beach.

hi Ronald,

A guy in Australia has already expressed an interest, but he might not want everything. Are you only interested in the computer itself, or other stuff as well? For example, I have several of the old Abacus books etc.

At some time in the near future I'll get it all together in a pile and make a list of what I have.

Steve.

Folks, I've gotten my first Falcon pretty well setup so I'm offering up my 2nd Falcon for sale. Its on Ebay. Its a 4 meg RAM, 1.4 gig HD comp. All keys, good shape, very clean. The only problem may be a questionable expansion port header. Let me explain. I sent it off to Mark Ducksworth for the motherboard mod and while he was doing this he had some problems with the header (random crashing). He did some work/repair to it and it seemed to be fixed. When I got the machine back, I re-attached the CT60 and the machine would work fine for about 20-30 mins then crash. I talked to Mark about it and he took a 2nd look at it. Right before this I had picked up a 2nd Falcon so I sent them both to him and had him switch everything out just in case. He took the MB mod off the 1st Falcon and set it back to its original state. The point is, that doing this 2nd period, Mark could not get it to crash or do anything like it did on me. Thats why I say questionable. I felt it was better if I told everyone about it though, before considering buying it.

Hi,

> Well, atari market is very small, and amiga one is still quite big, so even
> HAWK will arise I think its bring more cons than pros.

This is the reason why i always ask for use a existing board instead of
develop one only for the atari market.

> We don�t need PPC! Amiga is different! If you need PPC its mean you need
> full emulation of atari, so wheres the point of new atari PPC CLONE?

For more CPU power. This will open the door for new ideas of applications.

If you look at the web there is also sometimes the need for more CPU power. From time to time i have seen websites which requires more CPU power than a 80486 or 68030 has. E.g. some people have pictures but dont scale them down for thumbnails, instead there is only the width and height attribut in the tag. And my computer has to do the work. On my additional 200 MHz Pentium on work this took more time than i expected for this site. The same with ebay. You need a slow pentium as a minimum to process the java script.

If you dont want to wait the whole day to convert a cd to mp3, you also need a little more power than a 68030.

And what about video?

You can have plenty of ideas for more cpu power.

Regards
Michael

Well, I have to admit...I met my wife (partially) on my BBS! True story, although I had met her casually at the grade school where her son and my son attended.

She began logging on to DarkForce and we started chatting...and one thing led to another. :-)

Henrik,

And of course I understand you guys are just two people and I understand
the limitations that real life creates for such projects. When the CTPCI
was announced, it got my hopes up because I realized I had some sort of
high resolution video solution while I'm waiting for the ultimate
solution, the supervidel. So I guess we'll see ;)

Mark

A LITTLE more ? I have once tried to convert one little song to MP3 using bladeenc on my Falcon030 before I had a CT2b board, fast RAM, and a 68882 FPU. I actually succeeded but I'm afraid you need even more than one whole day to convert a complete CD to mp3 on such hardware. I now could do this much faster on my Aranym box. But why should I if I can do it even faster on the Linux host OS that I'm using to run Aranym ?

Perhaps its because he doesn't have anything but Atari hardware? :-)

Seriously, I use Mandriva Linux on my 3 comp LAN at home, but until 2000+,
I only had Atari hardware in my home as well. Proudly, I can say that I've
never owned any MS product...

Fate willing...I never will.

Hey guys,

I know these may not be the perfect groups to ask this, but I have been dying to get my hands on a copy of Battlesphere. Now anyone who watches eBay can clearly see the prices go into the $500+ range. Now I know I'm not going to want to play this game for very long, so I feel I don't need to own it.

Therefore... I was wondering if someone could rent their copy of Battlesphere to me for a couple weeks to a month. I'd be willing to pay $20-$40 or something that's fair for this service. I imagine many jaguar owners would be willing to pay this too ;) I have references so you know you'll get it back and you know I'm good for the rental money.

I'm in the US, but that doesn't really matter much for something like this.

Thanks,
Mark

I too have a copy of xgem. I tried unsuccessfully to convert it to compile with gcc. Now that I have knowledge of certain tools to do this (fvdi conversion was successful), I'm thinking about trying again. I was going to use this library for GIM, but to be honest, I'm glad I used windom instead since it's such a great easy high level lib.

I wish Eric would be more happy with GPL so we could import the good parts of XGEM (fonts, asthetics, etc) into XaAES so all programs could benefit from those features. I really haven't ever seen anything more pretty than xgem programs like find it and myPDF on Atari... Sorry to other lib creators ;o)

Thanks,
Mark

alt.atari-jaguar.discussion would probably be the best place.

$500, huh? Hrm... maybe I don't _need_ two copies.

frazzle

What am I thinking!?

Anyway... :^)

Where in the US are you? If you're anywhere near San Fran or San Jose CA,
maybe we can meet up for a round or two. :)

My girlfriend gets hot for my falcon. Just kidding ;) But if it wasn't for Atari, my life would be arguably crappier ;) I wouldn't have met my best friend of almost 10 years now. I met my current girlfriend of almost 5 years through him. So who knows where I'd be without Atari ;) I also wouldn't have anywhere near the level of skills I have if it wasn't for Atari. The machine inspires me.

Thanks,
Mark

Hey guys. I just won a Compatibility 2 plus off ebay for a great price.
Only problem is, there are no docs included.

Anyone have this device and be willing to photocopy them and e-mail/snail
mail them to me?

I'd be perfectly willing to reimburse anyone for the trouble. I already
tried a dealer in the US, they said everything from Wizztronics is
copyrighted so they can't legally do that.

Thanks everyone!

Hey Mark,

Get a cheap flight to the UK for the weekend 22-23 Oct, and come to
Jagfest UK. You can play Battlesphere for two days solid if you like...
;-)

Or you may be able to persuade one of the owners to part with one for
around $250 equivalent.

Coda.

Just like me. I have never even Bused MS Word, MS Explorer, MS Excel, or
MS Windows.

Only recently I have started using Linux on a second hand
laptop. No dual boot together with MS Windows, or Knoppix CD, just Linux.
I have installed ARAnym on it and have a lot of fun both with the Atari
software and the Linux software. And my Falcon030/CT2b is still doing it's
job fine also.

Not a dumb question LP. I went to their website, they don't have an e-mail address so I was waiting until they open up today. We're in different time zones.

Just thought I'd go ahead and try here as well.

Thanks!

I'd imagine there are actually quite a few just like us. :-)

Its like the man said, "in a world without fences, who needs Windows and
Gates"? :-)

See ya.

Right :)

I never had PeeCee.

Anyway beside ATARI I mostly use MAC OS.

Yes, saw those. I talked to them by phone this morning. Get this, they are
closing down for about a week to go help with the Katrina problem in LA.

Kudos to them!

After that, the person I talked to (Steve) said he should be able to copy
the docs and get them to me. Great bunch of people there.

Now I just have to be patient for a couple of weeks. :-)

Thanks.

I am looking for a source to get a couple of drive belts for a ST 520fm built in floppy drive. The existing belt became a glob of tar so I need to find a replacement. Being this is the internal version of the 354 drive, it is belt driven as opposed to the direct driven 314. I also have a 354 that did the same thing so I am in need of 2. I can be contacted here or at adambrannon@yahoo.com. Thanks for any help.

Hi,

This video mode requires a 1280x960 (monochrome) capable monitor. As far as I know, this mode isn't often supported by standard SVGA monitors.

Cheers,

Mathieu

The TT high res outputs ECL signals (emitter coupled logic) which are
not VGA compatible. You can't display TT high res on a VGA monitor
without an external converter. I don't know if this kind of converter
still exists... However, you will find here info about VGA to ECL
conversion (http://users.tkk.fi/~pelle/vga-ecl.txt), try to do the
reverse ;-)

I have not heard about that for some time now. For PDF for the Atari there is
Porthos and Zview. Both do a great job.

I have a variety of SCSI Cables for Sale.

New in Package.

50pin to 50pin SCSI (Like Falcon port)

50 pin to Centronics

68 Pin to 68 Pin

And others.

These are High Quality Cables. Originally Priced at 50 to 60 US Dollars each!!!

Will sell much cheaper.

Contact me with the type of Cable you need.

Don't forget Calamus with the Calipso module! Latest version is 3.21
dated 13/7-2005 if you like fresh software.

Add to that Bridge 6.07 dated 29/8-2005 and you can make your own pdf
documents as well.

Calamus is not for free but you really get a very competent dtp
application that will at least run both under MS Windows and Atari.

Thanks to all who reponded.  I got an Eizo Flexiscan monitor with the
TT when I bought it but it's just too big to have as a dedicated Atari
monitor.  I'm putting it on Ebay fairly soon if anyone is interested.
(Bedford, UK).

Cheers
     Dave.

Feedback is now filtering back!!!  :-)  They're happy with it!!! :-)

Phew! and Yayyyyyyyy!!

<Message to the 16 or so watchers>
Buy it!!, please, don't leave it until the last minute. :-)  Then I'll
put some more together.  I started taking them off 1 by 1 at the last
auction as they sold privately by cheque in the UK.

Aly

Here it goes again. Had MiNT up and acting stable for about a week. Gave it a clean shutdown, and when I restored power and rebooted, my external drive had lost its name. It finally got it back when booting into single TOS. For this I blame the kernel, which has not screwed up before.

For not being sure, I blame me. I do have Egale, and could have compared kernel copies. Did give my auto folder a fresh Easymint copy, and now MiNT is happy again, but I did lose a lot of data. Darn.

Jim

The UMich archives used to be the main place to get Atari freeware. However, as you noticed, it is now rather unsupported. (The only remaining active site that I know of is Martin's site in Belgium.) I seem to recall that someone mirrored the UMich site a while ago -- does anyone have an address?

Well, I hope it's not gone. I emailed Martin-Eric about two years ago offering to take over the FAQ. He said he would think about it. Then about a year ago I reminded him of my offer. There was no reply.

In any event, much of the FAQ would have to be rewritten. I think the last modification date was over three years ago. :-(

Galen

Some printers have their own drivers, while SpeedoGDOS and NVDI were multipurpose printer drivers.

Unfortunately, most modern printers have drivers that don't exist for Ataris. Look for "Epson ESC/P", "Epson LQ", "Epson FX", "PCL3" and "PCL5e" emulation modes. I would think the Brother and HP laser printers would be the choices most likely to work today, although there are some reports of other printers working to some extent.

Well, I'm typing this right now on the WinXP laptop assigned to me at
work.  (It's Saturday at 6PM, so I'm not that concerned about being on
the company's "dime".)  More than anything, working on Windows here has
convinced me not to bring one into my house.

Galen (now up to 6 Macs, 2 Falcons, and 2 STs -- the Falcons do most of
the work)

The problem with Battlesphere is that the group (4Play) never really had a marketing guy. (Well, they had one, but he bailed long before the game was out.) The game was finished (IMHO) simply because they didn't want to give up. After it was done and polished, actually selling it appeared to became an afterthought.

I wanted to buy a copy of Battlesphere and would check in at their website every month or so. Then one day I checked in to discover that they were sold out. Rather disappointing, to say the least. There was later a small second run, but they had some problem finding components and the available copies went for far more than the $75 I was willing to pay.

I'll probably never get a copy now, as the programmers have moved on and apparently have no interest in another run. I think the total number of copies out there is under 200, if memory serves correctly.

Are you kidding?! $500 for battlesphere?!

Did you check some of the retailers that still have Jaguar stuff? I'm sure that I saw one last week(can't retrocomputing? or something similar maybe) for $5 IIRC, and AvP for ~$25...

(Also read a review where someone gave Kasumi Ninja a decent score, as opposed to the nearly universal lambasting that I've seen virtually everywhere else... Personally, I think it's OK, but not as good as it could/should have been as with many of the Jag games...)

Wouldn't this have been better posted to one of the Jaguar groups anyways?

Actually if you look in the top level of the ST section the maintainer requested response from archive users and apparently got more than he expected. I suspect that the site is safe for a while yet, besides it looks to be mostly duplicated by every other free/shareware archive any more.

(I remember when it used to be THE site as well, although it seemed to have been missing quite a few items as compared to the old online services(GEnie, CI$, etc).)

The Apple2 & 8 bit sections I think have definitely be superceded by other sites, although GS stuff seems to just be generally difficult to find. (I suspect that the paysite syndicomm has more stuff stashed, but I'm not going to pay $35 to find out or for the "privilege" of using their forums.)

Yeah, I ain't paying for that. There is some site, called "What Is The Apple IIgs" or something like that, with lots of software for the IIgs, and there's ftp.apple.asimov.net which is the "definitive" Apple][software archive. I wonder if there's anything like Asimov.net for the ST.

Are you kidding? Kasumi Ninja rocks. I still think it was a humongous
joke. I mean what other game could you make a guy shoot fire from under
his kilt!!!!!!!! The cheese factor is through the roof, making it a total
joy to play ;)

Pathetic. They can make a jag cd version now that the encryption is broken. This reduces the price to very cheap ;)

I'm waiting for those twits which complain about totally irrelevant things like the colour of the box or something still :-))))

I can see it now....

FEEDBACK 652....

Arrived quick, fantastic product, works very well, only thing which let it down was it would have looked better in a black box.. Other than that it was fine....

Ohhhh, you just KNOW its going to happen...... ;-))))

I've got the BFG's on standby :-))))))

morning rant over :-)

Chris

I'm having problems finding it on the 'Net. I found the "comp.sys.atari.st" version. I found a 4 part version from somebody named "Nick Bales". The first part of it is in French. I tried running it through babblefish, but it still didn't come out very clean. I appended everything legible I could find together, with notes, and added them to the main menu on my BBS, leaving all credits in place.

Whenever others can supply newer info or I can find it, I'll update as I can. Even though its older, it still does have useful info in it - what seems to go out of date is things like links to web pages and companies that are no longer around/in service.

Thanks.

Hehehe, that is funny and eerie... I met my wife partially because of my
BBS running on my Atari. She would logon and chat with me. It was cute
then. Now that we're married...its like you said. :-)

Jim DeClercq wrote:

> Here it goes again. Had MiNT up and acting stable for about a week. Gave it a clean shutdown, and when I restored power and rebooted, my external drive had lost its name. It finally got it back when booting into single TOS. For this I blame the kernel, which has not screwed up before.
>
> For not being sure, I blame me. I do have Egale, and could have compared kernel copies. Did give my auto folder a fresh Easymint copy, and now MiNT is happy again, but I did lose a lot of data. Darn.

I wonder how you managed that. I'm been using MiNT (stable and beta versions) since 1995 and sofar I never have lost any data. For me MiNT has proven to be rock solid. Right now I'm using MiNT kernel 1.16.3 and XaAES (latest CVS build) without any hasle.

But as always make backups on a regular base.

>and how you do it without hddriver? ;)

Slowly! :-) Seriously, there is no better hard disk driver than
HDDRIVER and it's well worth the money. Note that if you want the
English manual for it, you have to buy the package from Atari Workshop.

Regards, /Peter/

Why do they have to be thin? Of course dont try to use 110V mains
wires, get a spare piece of flat IDC cable and tear off two wires.

NOOOOOOOOOOOOOOOOOOO!!!!!!!!!!!!!!!!!!!!!!!!!!
Must be single and as thin as possible - or it might lead to some
ununderstadable, strange and unexpected behaviour :-(
```

Who is your ISP? Ever since Comcast increased their overall connection speed,
my Hades just flies on the connections. I can download about 1000 messages in
about 2-5 minutes using Newswatch. That suites me.

Would this be true with the analog LCD panels that have VGA input?

Hey guys,

My falcon is just itching for some good video. The EtherNAT is now paid for, so now I have to ask the question. How soon will the EtherNAT's be manufactured? And afterwards how soon will they be shipped?

Okay now what about the CTPCI? I'm hoping that I will be able to put an ATI Radeon card in it and use some good video modes until the supervidel is done...

And what about the Supervidel? Any progress?

Thanks,
Mark

VGA input probably only accept VGA standard (SVGA, XVGA..) so probably between 30-50Khz, specific rate must be specified in product info sheet. Problem as i see it with LCD is fixed resolutions. That means that display will be either small on LCD, or resized and not very sharp. Also, some apps. demos and games, use own resolutions, some even switch them a lot, which add

```
to the problem. Thats why i prefer CRT personaly. In combination with external
VGA TV tuner (avermedia JoyTV) works very nice. That way u can watch TV,
Falcon RGB, ST low/med, etc, etc.. without much hussle..

   Janez

It seems that the OS on Amiga is far better than on Atari...
I just hope that some news things will arrive on atari to reduce this
incredible difference !

I don�t get it!

Did you saw AMIGA OS for first time?

Or what do you mean "incredible difference", scrolled screens?

The other day I've had an AICQ discussion with Paul Williamson
(Briton) about the meaning of "some time ago". It seems I've another
idea about that as he does. According to me "some time ago" means

recently, not that long ago. Pauls says it rather means not recently, quite a long time ago.

So some time ago does this means weeks, months of years? AFAIK nobody he seem of spoken to Gary since at least a year (probably more).

My ISP is Telenet Belgium, AFAIK the only ISP who offers cable. Cable is faster then DSL.
Mind you I can't use Newswatch to send messages out because for some reason it fails in User Authentication. Retrieving messages is not a problem and goes really fast.

Popwatch OTOH fails to download large mails (25 kb and more).
Sending out large mails doesn't give me any problem.

Popwatch returns me a warning like this:

```
RETR 9
+OK 8403382 octets
CNbyte_count= -27952 Unrecognized error
```

I've owned a couple of Amiga models (A1000, A2000, A1200). They are okay.
I still much prefer the newer versions of TOS and an accelerated Falcon.

;-)

PS BTW, hasn't OS4 been "coming" for a very long time? :-)

Well, drivers come with programs, if you want to print from a
program, and NVDI provides printer drivers for programs that
will print to it. Need more information.

If you have an inkjet that will only print bitmaps, you need
a program that outputs bitmaps to a printer.

Need much more information.

I've not seen a Falcon with a 680x60 board, but hey Amiga OS4
pre-release 3 is running on a PowerPC chip.
I don't think that there's competition there :) (I'm not trolling at all
its just the truth.)

Beside that I love Super Sprint on the Atari and it was never ported to
the Amiga, I'll maybe do the port myself one day.

Elemental is great too!
Its clear that the original Amiga was did have a better hardware, but I
assume that ST coders were the best as they've to do all stuffs in
sotftware on the original ST at least.

regards

Thanks for the info.  I will look for some
programs that have inkjet drivers.

Well, from the name and picture, looks like a quite nice-looking
organizer/calendar program. Can't wait to hear the details! Hopefully
it will be in English as well as French. The GUI looks very cool!

There is a lot of eye-candy in AmigaOS4. Once we get some faster
graphics hardware we could have some of that too, hopefully.

Personally, I don't think you should underestimate FreeMiNT/Xaaes. It's
```

a really mature operating system which runs quite smooth on the CT60.
Try the latest alpha version!

Perhaps we lack a real "turnkey" distribution. EasyMiNT is really good,
but you still have to do some stuff manually to get a smooth running
system with all the goodies.

regards

Well, in my point of VIEW, theres a BIG HOPE, a MyAES, really solid piece of OS, and with DIRECT Desktop its look very very good, so what we need its to support these!

Anyway, a TRULY EASYMINT! is for sure better way to promote MINT!

Eye-candys are not the central point of OS, but they are very useable, its much better when your OS looking good.

I agree fully with you here, FreeMiNT/XaAES is at this time the best option to proceed for anyone that wishes to have an up-to-date OS on their Atari/clone/emulator. It is by far the most stable and complete AES that we have at our disposal right now, and the eye-candy area is being looked into. As Peter noted, anyone who has yet to test latest XaAES public alpha should definately have a go at it and have a look!

And yes, what is left of our platform would definately benefit from a really solid distribution. A distribution that could make a transition from MagiC over to FreeMiNT as smooth and less problematic as possible.

Regards,

/Joakim

Well, atari market is very small, and amiga one is still quite big, so even
HAWK will arise I think its bring more cons than pros.

The best way should be NEW 68k FALCON, like PHENIX! but more compatible with
FALCON. And Ct60 seems to be very good predecossor of new FLACON MOTHERBOARD
with SUPER VIDEL graphics card.

We don�t need PPC! Amiga is different! If you need PPC its mean you need
full emulation of atari, so wheres the point of new atari PPC CLONE?

You can get very cheap MACINTOSH with POWERPC and install EMULATOR ON IT!

I totally agree with you. I'm using FreeMiNT/XaAES on the Hades since quite some time now. Before I was using FreeMiNT/N_AES 2.0.0 but I really don't have any reason anymore to go back to N_AES. XaAES runs very smootly. All the apps I use daily, except one, are working like a charm. There is a small redraw problem with Okami but AFAIK, that's due to Okami and not XaAES.

> Perhaps we lack a real "turnkey" distribution. EasyMiNT is really good, but you still have to do some stuff manually to get a smooth running system with all the goodies.

Personaly I prefer to do things manualy. This way one knows what to do if something goes wrong. Anyway I used the EasyMiNT installation too. Compared to previous installation kits EasyMiNT is a piece of cake.

I did once a Magic Mac installation and I found it very hard to get things right.

> due to Okami and not XaAES.

Yeah, I used to have a few incompatible apps too. There are quite a few of those on our platform, unfortunately. There is no way we could compensate for that in the OS without sacrificing something else.

Personally, I have choosen to ditch the applications that won't work right away. I think that's the way to go - not to invent workarounds in the OS all the time.

> Personaly I prefer to do things manualy. This way one knows what to do
> if something goes wrong. Anyway I used the EasyMiNT installation too.
> Compared to previous installation kits EasyMiNT is a piece of cake.

Actually, I have nothing against doing things manually. However, every new FreeMiNT user has to reinvent the wheel, and there is no point in doing that.

Does not happen like that on my end. Sounds like an ISP problem/compatibility
thing. Now and then Popwatch fails the authentication when signing on, but
after a while, things are fine.

Guys, I'm trying to find the complete text of the Atari ST quick FAQ. Or
any Atari ST FAQ. Full size would be even better. I google searched it,
found a lot of dead links/pages, as well as several that points to
Martin-Eric Racines page. But I can't find anything on his site to do with
Atari.

I also would like to find a TT030 and Falcon FAQ if possible.

I'd like to put them up on my BBS.

Thanks everyone!

visit the university of michigan archives at:

http://www.umich.edu/~archive

there is apple 2, atari 8bit and st stuff there. it looks like a
forgotten archive so better visit it before it disppears. so many good
archives are vanishing these days.

Hi,

Any news about the mypdf project ? The homepage
http://mydpf.atari-users.net hasn't been updated since 12/2003. It looked
like a promising project then. Is it a sleeping project, or is it just
dead ?

The main programmer of MyPDF, Rafal Kawecki is now out of bussines.
Unfortunetly one who got all SOURCES now is ME :)

I dont think MyPDF will went ahead, simple because Rafal dont have ATARI
anymore :(

So bad, because indeed MyPDF looks very promising, especialy GUI, which was
wrote with Eric Reboux Library (XGEM, DIRECT,MyAES), a great piece of
software for programmers and users.

> Eye candy doesnt make a better *OS*. It makes a prettier interface.

Yet, it is a part of any modern OS. It makes an OS attractive to use;
like having a nice looking car compared to a rusty one. Both work
equally well, but one of them attracts women, the other one does not.

... not that my Atari will ever attract women.. Or has that happened to
anyone, ever?

I lost the point somewhere, sorry.

Yes, developing or rather administrating all the payments... ;) And I usually don't check this news group very often.

When we have received enough payments to ensure that we can afford producing the EtherNat without risk of going personally bankrupt, we'll start the production. Unfortunately the production in itself means about 6-8 weeks time, because some components for the EtherNat aren't in stock at our suppliers. This was the case the last time we checked at least, but we've noticed earlier that this may suddenly change for the better. So we prefer to give you a worst case estimation instead of any "false promises".

Regarding the SuperVidel we hope you realize that we are only two persons, who have to work to make a living, so development is restricted to our spare time. Because of the EtherNat the SuperVidel is on ice, until the EtherNat is out the door. But we have still had some time to think of improvements for the SV, so when we're taking it up again, we'll know what to do.

/Henrik

Hi, I'm Ben Smith here in Portland, Oregon USA! Proprietor of Bravo Sierra Computers! Occupying a unique niche in the Atari World! Most Atari Dealers sell NEW, I also sell Used Atari Goods! Not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you wont find at Swap Meets, Thrift Stores or Auction Sites! And I sell for less! Unlike those remaining anonymous! I test Goods before I sell them. Not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, because I'm the guy people goto to give Ataris a New Home! Saving Orphaned Atari's from Oblivion!Goto http://BensCatalogs.Atari.org or (503)256-9974!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

It is good that we have two free alternatives; I think everyone will benefit from that in the end. We need to support both, and help the authors in any way we can.

Hopefully, Odd Skancke and the Myaes authors get along and talk to eachother, so that compatibility between the two AES flavours won't be an issue..

Hi!

I have had more attractions in the time, I used the AMIGA. But maybe bez. I was seven or so, when I used the ATARI.

With the Atari TT I have, I don�t know. I do not use it yet. For now, the TT is laying around, half opened (LED must be repaired, they were so rusty that they broke without many touching). But it is prepared. Maybe I will get attracted again with the TT :-)))

Kind Regards,

Daniel Mandic

P.S.: ATARI

What model? Usually with the TEAC there are solder pads on the underside of the drive. They are listed as ID0 and ID1. Move the SM resistor 90 degrees. It is only a wire (0 ohm resistor) bridge, so if you want you can bridge it with solder.

Mark

OK, i asked as I'm in the U.K. and have a selection of modded STe's that do
nothing but gather dust.

I know shipping would be high, but how much are you asking for them, and
what kind of mods?

Thanks much!

Hello,

Musique.Atari.Org Web site address was changed...
Please, don't use http://atari.georezo.net , but use now
http://musique.atari.org or http://atari.apinc.org ...

Music.Atari.Org was changed too, and it's now only dedicated to Atari
music software : ATARI Music Software (AMS)...
Please use now http://music.atari.org or http://atari.music.free.fr to

go there...

Thank you for your attention :-)

I know that this is a great product, and they have worked on it long and hard.

I just figured out what it would cost me personally (someone please correct me if I got the figures wrong):

100 EURO for the board
17   EURO for shipping

4.68 EURO for the 4% Paypal transaction

121.68 EURO

Which equates out to $151.04 US dollars. That seems a bit high, considering that ethernet cards are about dirt cheap here ($10 or so?). I have Rorys' EtherNEC setup, for around $75 and it works great. I know, I know the performance of the EtherNAT is much greater, doesn't use the cartridge port, etc, etc,... I would really like to have one though. I guess I'll get flamed for even posting this... Oh well. :-(

Just musing... whats everone elses thoughts on this?

Yes I agree. I have seen them for sale for about $250 which is what I paid for mine.

I talked with him some time ago so he is still around. What versions of Newswatch and Popwatch do you have? I have version 2.91 of Popwatch and 2.5 of Newswatch. My Okami/Newswatch/Popwatch system are working just fine. I have Comcast as my broadband connection.

Hi,

I'm looking for a SCSI ZIP drive at the moment for just that purpose.
When you talk about sharing a drive do you mean by something like
Samba?

Dave.

>The quickest solution is to share a hard disk drive by creating a
>partition on it that can be read/written by both the PC and the Atari.
>A hard disk will do for that, a drive with removable media, e.g. ZIP,
>will do as well. A CF card can also be used, but this requires a CF card
>adapter, of course.

I'm having problems with latest Aniplayer 2.22 on my TT running Magic 6.20 related to the various SLB files.

To encode mp3's I need LAME_ENC.SLB but if I try the (only available) 68060 version I get an "68000 exception nr -69" and Aniplayer exits.

The doc's says:
 Requirements:
  - 68020 or higher
  - FPU or 68060
  - MiNT 1.15.3 or MagiC 6 or MetaDOS 2.74.

so I should be fine with my 68030 with fpu but it simply doesn't work at all!

However... if I use the older Aniplayer 2.20 LAME_ENC.SLB it's OK! Both the 68060 and 68881 versions work (68881 slightly faster).

The 2.22 version is compiled with Gcc 3.3 and 2.20 with Gcc 2.95.2.

It's also interesting that the same happens with AVCODEC.SLB when encoding mp2: 68020 (Gcc 2.95.2) is OK but 68060 (Gcc 3.3) exits with the same error -69. Here both versions are present in the aniplayer 2.22 package!

So far by mixing versions I'm able to write both mp2 and mp3.

To encode Ogg files VORB_ENC.SLB is used but unfortunately there is only a 68060 (Gcc 3.3) available in 2.22 and non at all in the 2.20 package. This version also exits with error -69, so at the moment I'm unable to encode Ogg files with Aniplayer.

Anyone with better luck on either TT or 68030 Falcon??

No, I mean partitioning a ZIP cartridge so that you can use it with both the Atari or the PC. Write data on the ZIP with the PC, then use the cartridge (in another ZIP drive, or the same) to read these data with the Atari. Or write data with the Atari and read them with the ZIP. There is no network connection. The data are shared via the ZIP cartridge.

Rare, I dont think so. Hard to find yes.   I have purchased 2 of them
in the last 4 months. One was sold and the other is awaiting a new
case.  I usually check here to see if anything is wantedd before I sell
it on Ebay but never get any response so its usually sold on Ebay.  I
start all my auctions under a dollar.  I have a ton of stuff and
constantly get STuff.  Im located in California.  If anyone wants the
STe after it gets a new case email me and will talk.

BTW I just posted a bunch of Atari ST stuff on Ebay today.

From their website (http://nature.atari.org/):

EtherNat
Ethernet and USB card for the CT60

This board for the CT60 expansion port gives your Falcon 100 Mbit Ethernet and USB 2.0 support (low/full speed)
Background
Using the existing LAN adapters for the Falcon, you should be able to get approx 400 Kbyte/sec. The problem is just that you have to use the cartridge port. This seems to be a great problem for us, because none of the cartridge ports of our falcons are healthy. This results in ~5KB/s transfer rate for us when using the EtherNEC. In the summer of 2004 we grew tired of this and started designing our own network card for the CT60. After a while Rodolphe persuaded us to add USB functionality to the board as well. So in the end the EtherNat ended up to be an Ethernet+USB board for the CT60.
Ethernet features
* 10/100 Mbps Ethernet using the SMSC LAN91C111 controller.
* Mintnet driver for Ethernet. Should work with Magicnet too.
USB features
* 2 channel USB 2.0 support using the Philips ISP 1160 controller.
* Low (1.5Mbps) and Full (12 Mbps) USB speeds are available.
* Uses an USB header cable to let you place the USB connector in your Falcon/tower case where you want them. Bought separately.
* USB driver developed by Jan Thomas. Homepage
* USB peripheral drivers developed by YOU.

and to be fair, I forgot to mention that the EtherNAT does offer USB support as well. My apologies.

Ethernet cards are dirty cheap. They also are produced in BIG quantities using templates to make production even cheaper. I doubt any of those companies woud be able to design a card from scratch, for a strange machine, and produce 100 cards for less money as Nature (or Rodolphe with ct2/60 etc) did. U dont get just ethernet card, which anyone can buy, no matter what the cost is. U can buy really expensive GFX card, u still buy mass product. Here u get rare piece of equipment, done in small series. I only have 1 PC, and money spent in Falcon is still less as i spent for PC. Difference is my Falcon gets faster and more useable every year, PC goes the opposite way..

Personaly, i never regret money i spent for those odd devices.. After all it is only money, and if have to earn it hard, lets spent it for something special, 100E is not that much ill go bancrupt, or make me rich after all. And my experiences told me, that if i would not buy ethernat, enec etc, money would be spent anyway, proly for more foolish stuff ;)

Alternatives:

You can have CTLink from Rodolphe for 100EUR.
Or you can by CTPCI and write (or find somebody) the driver for a PCI
ethernet card :)

Interesting test. Have you contacted the author about this issue ?
I might have a similar problem on my Falcon030/CT2B+68882. I'll try using
the codecs compiled with gcc 2.95.2 and see if this fixes the problems I'm
currently having.

If the disk is partioned on an Atari could it then be read if swapped
to a zip drive plugged into a PC? Basically I'm  saying are the zip
disks hot-swapable?

Yes, provided that you have partitioned the ZIP cartridge with a special
option offered by the HDDRIVER package. This option creates a partition
that can be used by the PC as well as by the Atari without any
additional software.

I've the same versions of Popwatch/Newswatch as you.

I really think it's a speed mather. I've 3 computers (mac + linux box
+ Hades) connected to a router. If I let the Linux box download/upload
a large amount of data I can get big mails on the Hades because the
connection speed on the Hades isn't that high anymore.

A while ago Erik H�ll tried to explain me why Popwatch gets in trouble
but alas my memory seems not to be that good anymore.
I believe it has something to do with the CNbyte_count() call that
returns a large number which Popwatch sees as an error.

Earlier versions of Mymail were suffering the same problem but Erik
has solved this.

I'm using the cable and according to a speedtest it's running at 2545 Kbps

If you ever get in contact with Gary again please ask him to release the
sources. A good home for his soft would be TOPP (The Orphaned Projects

I agree with everything you're saying Janez, absolutely. I've spent much more on my Falcon *recently* but it was worth it, down to the very last penny. Overall, I've spent much more on the hardware needed for the 3 Linux comps in my home LAN.

I guess I'm really just whining/complaining because after buying the CT60, Rev6 CPU, CTcm, and Wizztronics rack case, I don't have money left over right now to buy the other super cool things that are coming out.

Does that make sense? :-)

Well i cant judge for yourself :) I have ethernec running fine. And im not interested too much in USB part of ethernat.. But it wouldn't make sense on my side if i would let it go :) I'll try to get Ethernat ans a CTPCI, altough wages here are quite low... :)

  You will just have to judge if i can get Ethernat or CTPCI or both :)

  Janez

And I must say that work just great. All my zip's are partionated this
way. They can all be used on pc and Mac without any problem at all.

>Is there an English version of Splitter? The only one I could find is
>in German.

Yes, there is. Do you want me to send it to you? It's just over 100 kB and includes both Atari and PC-DOS (286 and 386) versions. It was first published for Atari ST User magazine and included on ST Club disk DM_43.

But your problem could perhaps also be solved with ZIP-Split and ZIP-Rebuild. To quote from the instructions:

'The aim of ZIP-Split and ZIP-Rebuild is to recover ZIP files for which ones ST-ZIP says that they are "damaged or not a ZIP file at all".

'ZIP-Rebuild will explode the ZIP file in as many files as the original ZIP file contains. ZIP-Split will uncompress the archive.

'Don't expect miracles from ZIP-Split/Rebuild. They cannot rebuild the data. They will only process the parts of the archive that are uncorrupted.'

HTH

Does anybody know how the USB driver works? I just wonder if one can connect CF cards to the Falcon by using a stock CF card reader/writer for the USB and then use the CF card like a hard disk.
This would probably be a more convenient solution than connecting a CF card adapter to the IDE port.
A SCSI driver implementation for the USB port would be needed to get everything working, but this may be an interesting programming project.

There isnt one yet. I am currently looking at how to implement the mass storage class. I think the best way would be to have the driver for the mass storage devices boot BEFORE hddriver, so hddriver can find any hard disks and use them with the standard command set. Hopefully this would not entail a re-write of any of hddrivers code to support them...

Coda.

>
>Interesting test. Have you contacted the author about this issue ?

Just did.

But some of the SLB README's clarly state:
"compiled with Gcc 3.3 with -m68060 and libm2060"

and older ones:
"compiled with Gcc 2.95.2 with -m68020-60"

so it looks like 68030 support got dropped in the last 2.22 version. It's
really a slow process to encode to mp3 and ogg files. About 100 minutes
to get a one minute file but still useful if you are not in a hurry...

They say "slow food" is good for your stommach so maybe "slow computing"
is good for your brain :-)

>I might have a similar problem on my Falcon030/CT2B+68882. I'll try using
>the codecs compiled with gcc 2.95.2 and see if this fixes the problems I'm
>currently having.

I have now managed to get both mp3 and ogg encoding working by combining SLB's from Aniplayer 2.20 (LAME_ENC.SLB), 2.21 (VORB_ENC.SLB) and 2.22 (AVCODEC.SLB).

The older versions can be found at:

http://perso.wanadoo.fr/didierm/files/anipl220.zip
http://perso.wanadoo.fr/didierm/files/anipl221.zip

This can definitly be confusing to anyone as you also have several different SLB versions in all three Aniplayer versions...

No, on the contrary: That's the only way it would work. Implementing a
SCSI driver for mass storages devices is basically the same approach as
the one used for PCI SCSI on the Milan: The driver must be made
available before the hard disk driver is started. The hard disk driver
will then automatically detect and use the available devices.

Does anyone know if you can hook a PTC1426 Atari monitor to a Falcon and get both the lo-res ranges (for games/demos) and hi-res (640 x 480) with 8bit or 15/16 bit color?

Just wondering...Thanks!

IIRC it is just a VGA monitor, with the horizontal shift set up for the
TT (Via a switch on the rear). In which case the Falcon won't do more
than 640x480@256 colours, without help (screenblaster, Centscreen, etc).

Mark

Thanks Mark. Hmm, according to that, it can't sync down to the ST range so
it couldn't do the early Falcon RGB demos 'n stuff. Too bad. Its almost
impossible these days to find a monitor like a Nec3D that will do it all
for the Falcon.

I did find a place, but they are "specialized" which means low volume, or
in other words *very* high prices. Something like $1300-1500 for a 15" to
17" monitor. :-(

You could look at an LCD with both VGA and composite/svideo inputs.
Dunno how the Falcons whacky rez's would go though.

For quite some years now im using external VGA TV tuner, works like charm for Falcon RGB, 8 bit machines etc.. I just make cable to get Falcons composite out and that is...

So the question is, does the bootsector on the hard disk contain any
HDdriver code, or is it just a loader for hddriver.sys? Can I replace
the bootsector so that it loads my mass storage class, and have that
then call hddriver.sys?

I actually looked at some of those, with the TV stuff built in because it
seemed like it would work. I just hated to invest that much money to find
that it didn't!

Anyone ever use their Falcon with the LCDs with a TV tuner? Does it work?

This code (the same applies for any other hard disk driver) must not only locate and load but also relocate the driver binary. TOS cannot do that at this point. It also checks (as far as I remember at the moment) if the ALT key was pressed, which will prevent booting from hard disk. Except for the name of the SYS file the boot code does not differ much between the different hard disk drivers.
The safest bet in order to be compatible with anything is probably to save the contents of the root sector before modifying it for the mass storage device and then load and execute it when the time has come to load the hard disk driver.
Modifying TOS to initialize the SCSI driver for the USB appears the most elegant way to me. After initializing the SCSI driver the standard TOS boot sequence would simply continue and takes care of anything else, including bootstrapping the hard disk driver.

Hi All,

I have the ctcm and the 060rev6. I printed out the photo (from czuba's
site) of the ct60, but I can't find the area on the actual board
which is designated in the photo, which shows where the wire for the
ctcm are to be soldered.

Can anyone clear this up for me?

Thanks,

This is the way for the CTPCI.
PCI_BIOS -> SCSI_DRV -> boot with driver who support SCSI_DRV.
There 512 KB of flash on the CT60, so it's not a problem.

Regards,

Didier.

Thanks Coda,

I already had that info, but I had the orientation wrong!!!  I now see
where those 2 wires need to go.

Question:  How thin do those 2 wires really need to be?

Thanks!!
Samf

But if Gcc compiles with the flag -m68060 the code will not run on 68030?

Don't know if your README is correct but if it is I suppose the flag
-m68020-60 would fix the issue on 68030?

The CT60 does not itself add resolutions as far as I know. However, if you also modify the Falcon's bus to 25MHz, then the Videl can run a very nice 800x608x256 or 640x480x16bit resolution at over 60 Hz. Of course, somewhat higher resolutions and refresh rates are possible, but this will affect your computer's apparent speed due to the limited Falcon bus.

Your typical multisync (S)VGA monitor will do fine. This means practically any CRT made in the past 7 years.

Galen

Galen,
I have done it with Aniplayer. Usually a 90 percent load with NO skips. Get above 128 like 160 and it wont play without sounding like a record.
I have a stock Falcon that I gave to Mark D. to work on an accellerate for me. We have the DSP running at 50 mhz. the Videl at 40 mhz and the CPU/Bus running at 20 mhz. Then I had Mark put a 68882 FPU in and he overclocked it to 50 mhz. I have since removed the OSC. and installed a 64 mhz and it runs very nicely. When I recieved my Falcon back I immediately tried playing a 128 Kb/sec MP3 with 60 percent load according to Aniplayer. Mark did not tell

me what he got for numbers before shipping it off to me. Then I installed my Eclipse and immediately noticed a HUGE drop agian. Playing 128 Kb/sec MP3's went down to 30-40 percent with the average being in the upper 30's. Not bad really considering this is only a backup Falcon. I plan on hooking my EtherNec to this Falcon once I get my EtherNat for my CT60'ed Falcon. But doing all of that acceleration on Mark's part was well worth the money and coupled with the Eclipse it becomes a very usable computer with more than just demos now.

Thanks,
Carey

Thanks for the info. To clarify I meant the Videl is running at 50MHz (Bus 25MHz) and some monitors I have used allow significantly higher pixel dimensions that others when running true color mode for example.

I just did a quick search for Voodoo 3 3000 reviews and they were talking about
350 MHz RAMDACs and up to 2046x1536@75Hz resolution support.

...
```

>Right, and I expect us to use at least some of that hardware acceleration.

You can rest assured of that.

> I have an expectation for this mode to be possible - we'll see though if
> that can be reality.

I normally run my Eclipse/RageII at 1152x864x16bit@70+ Hz and that's blazingly fast (when you don't need to transfer colour data via the Falcon bus, that is). The monitor I use can't deal with more, but the card could. With a modern graphics card, the CT60 and the PCI bus are likely the only limitations on the 2D speed.

Anyway, the basics of 2D acceleration (mouse, blits and fills) should be pretty simple on just about any kind of hardware.

```

<snip>

Also, in case anyone cares:

5.25" drives require a longer seek time than the 3ms default of TOS(or at least the v1.0 that I have with my 520ST). I had forgotten about this, but while digging around for drivers for the IB 40 drive I came across an article by Dave Small re: adding 5.25" IBM drives to an atari, along with commentary about how someone else said that they needed a longer seek time than the default. From this info I dug up a lharc archive containing the original article by D. Small the additional commentary, several utilities, and the most important one of all, one that resets drive b seek time to 6ms. End of story: the 5.25" drive appears to be working fine again.

(The odd thing is that the only driver disk from IB Computers that I can find right now, only has a formatting program, so I must've lost another disk somewhere as I'm sure that they'd have shipped a similar utility, and in fact I think that I vaguely recall having an auto folder program to do the same thing, and forgot about it all those years ago as well... I suppose that I should also dump this into the ST newsgroup... gack crossposting... hope this helps someone else some time...)

I have just recently aqquired some Atari STs and am wondering how to go about setting them up. I am wondering if there is a PDF file out there of the old mannuals that came with it?

Cheers,
Colin

There is nothing to it.

Plug the power cable in the back, the TV lead to the TV (or the monitor
cable into the monitor if thats what you have), the mouse into the left
socket underneath the keyboard, a joystick (if required) into the right
socket and turn it on.

There isn't much in the manuals that you cant work out from looking at
and experimenting with the machine.

Coda.

>latest pcibios revisions.

No. The PCI BIOS which we defined for Milan and Hades provides exactly this information - in the ressource descriprots, the PCI BIOS tells the driver which endianness the bridge uses for each memory/IO space. Using this information, it should be able to write drivers that are not machine-specific.

>Michael, as you worked on various Milan drivers, could you tell us more
>about the vga part? Is there a generic VGA driver in Milan Rom that can
>be used on any card that support VGA modes (i.e up to 64K) ? Could it be
>modified/adapted to run on eclipse, hades or planned ctpci hardware?

There are multiple layers that need support.

First is getting the card initialized during power-up, before memory test etc. is run, so that the user can see error messages etc.. On the Milan, the Bootblock (which does hardware init, memory test etc., before passing control to TOS) contains text-mode init code for S3 Trio cards, plus a small 8086-emulator that can execute ROM BIOSses of some cards - ATI Rage cards are known to work, some S3 also. Other cards may need modifications in the emulation code, because is is basically a 8086 emulator with some 80386 extensions, and some modern BIOSses contain 80386 commands - so new cards may require implementing some additional opcodes in the emulator.

Using either method, the VGA card is set to 640x480 monochrome graphics mode when TOS starts up - this is basically a SM124-like video mode with an additional 80 pixel lines, where the CPU does all the drawing.

Next, the Milan VGA driver is run from the auto folder. It stays rersident and provides callbacks which TOS uses during VDI init, so that the ROM VDI can be used to drive the graphics card, and the ROM VDI calls the low-level driver for stuff like video-mode setup, and for low-level graphics

```
operations which are implemented in hardware (linedraw, blit etc.).

cu
Michael

Here's a last-minute reminder of this weekend's event:

Subject: Atari swapmeet to be September 10 in Columbus, Ohio

Here are details for the annual swapmeet to be held by the Columbus Atari club:

DATE: Saturday, September 10, 2005.
TIMES: 9 am to 3 pm.
ADMISSION: $4. (For vendors, including table: $6.)
PLACE: Oakland Park Community Building, 980 Lenore Avenue, Columbus, Ohio.
MORE INFO AT: http://www.angelfire.com/oh4/acec/acec.html
CONTACT: R. Wayne Arenz (rarenz at columbus dot rr dot com)

...as a side note, there was apparently only a single disk included with the IB drive. It contained at auto folder with the res.prg program, and a disk formatter. I learned by trawling through the STart magazine archives on atari-archive.org that the res.prg MUST be the FIRST program in the AUTO folder, and also, that, apparently, it REQUIRES a disk in the IB drive. The last part seems to be false as I did a quick experiment, and it seemed to still work when booted without a disk in the drive. I also recall that I must have had problems with this driver (changes seek rate) in the past.

The other program that I had was called dseek.prg and it changes the seek rate for drive B to 6ms. I obtained this program from the umich ST archive, Disk(IIRC) folder contained in the ibmdrive.lzh archive. This archive also contained the previously referenced articles by Dave Small and others about adding IBM drives to an ST and the necessity to increase seek time for 5.25" disks.

All of this was tested on a 1M upgraded 520ST, TOS 1.0, no other upgrades or hacks. The drive is the IB40, or the 40 track version of their 5.25" drives, and was hooked up to a standard SF314 DSDD drive. I'd presume that there are other utilities out there that will do the same, but in my quick search this was the best that I could turn up, and it would seem that using the dseek.prg is the most reliable way to go at this time.

Hi all,

sorry ive been quiet of late, my ISP decided to change news server and never told me so I have been without news for the past 2 weeks :-(Sorry if anyone has not had a reply from me during this time.

PCB's will be arriving soon, please see more info at http://www.cps-electronics.co.uk/web/PS2.htm

We still need more orders!

Alison has a couple of boxed versions up for grabs on ebay. If you want one then I suggest you grab one now as she will not be making many of those types.

If anyone wants to be a distributor for thier country then we offer bulk discounts where you get 5 FREE PeST and lower postal costs to save over �100! Discount on bulk orders only. Distributor can sell at what ever price he likes. Distributor will make some easy cash and customer for that country will be able to obtain PeST more local, ideal for people who can't send payment overseas!!!! everyones a winner! See the webpage for more info.

Chris

Amazingly enough, I never saw that documentation about the resource
descriptors until today!
As you say, they can indeed provide exactly this kind of information.

I suppose they probably weren't implemented in the Eclipse PCI BIOS, or I'm
sure I would have used them. If I had, the Eclipse/RageII driver may already
have been working on the Milan and Hades...
Not that it's too late to do something about that now, of course. I'll put it
on my to do list immediately.

I heard about that long ago, but never thought it could actually be true.
Sounds like an amazing amount of work for very little benefit (I understand
you don't use the card's BIOS anyway once the VDI is started?), or did you
have access to the emulator already?

Is such a thing as a "small 8086-emulator" even possible?

No, not really. Uwe started with emulator source code from some DEC Alpha project (which had the same problems regarding VGA initialization), but ended up writing something new.

>Is such a thing as a "small 8086-emulator" even possible?

The complete Milan bootblock fits in one 64k flash sector - including the emulator. IIRC, the emulator uses something around 32K of code, and not very much RAM (in excess to that which the emulation uses - but 64K should be enough for VGA BIOS usage).

The BIOS is not used once the card is under VDI control, but the problem ist exactly the first phase: getting the card initialized from reset to a state where is it VGA compatiblem and even able to display a text screen - the magic required to do this is rarely documented (even if you have full documentation - it took quite some work to get this working on the S3 Trio), plus it may depend on the special card and not only on the graphics chip (due to different types and amounts of memory, different DAC/clockgenerator etc.), so using an emulation to run the BIOS that comes with every card certainly looks attractive.

Hi, fellow Atarians,

My Falcon is running Magic 6.2 and MagicNet. I have one of Elmar Hilgart's cartridge-port ethernet adaptors which, with Vassilis's RTL8012.MIF driver, works nicely with an ADSL router/modem in 68030 mode.

However, although I have had no other problems with the CT63 (touch wood), this combination does not work in 68060 mode. Some things seem to trying to happen, in that the activity light on the adaptor flashes, but I can't establish any communication. I can't even ping the router.

My '060 is the full version, so I hope that the note in CT60/63 ST-Guide file about the cartridge port does not apply.

As I have put my hand up for an EtherNAT, getting this working may be a waste of time but I'd stiil like to try.

Any bright ideas?

By the way, the above set-up works nicely with my ST, MSTe and TT.

Hi, I'm Ben Smith here in Portland, Oregon USA! Proprietor of Bravo Sierra Computers! Occupying a unique niche in the Atari World! Most Atari Dealers sell NEW, I also sell Used Atari Goods! Not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you wont find at Swap Meets, Thrift Stores or Auction Sites! And I sell for less! Unlike those remaining anonymous! I test Goods before I sell them. Not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, because I'm the guy people goto to give Ataris a New Home! Saving Orphaned Atari's from Oblivion!Goto http://BensCatalogs.Atari.org or (503)256-9974!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Hi all,

I am thinking of selling my cheese box, it cost me a silly amout like �70 when I brought it years and and I have only ever used it once (got another video box im using these days), wonder if these have any value as was thinking of putting it up on ebay, if its only gonna go for a couple of quid then not worth the time in messing about.

Cheers,
Chris

Neat!

>The BIOS is not used once the card is under VDI control, but the problem ist
>exactly the first phase: getting the card initialized from reset to a state
>where is it VGA compatiblem and even able to display a text screen - the

Yes, I'm well aware that this can be a significant problem.

But surely the VDI side of things needs much the same anyway? Well, not
actual VGA compatibility, but at least a way to set modes you can draw in.
Obviously, such modes will not work the same on all cards, unlike VGA, but
```

you need to be able to use them later, anyway.
(Unless you want to be able to have the system work on unknown graphics cards albeit without acceleration.)

For the Eclipse/RageII we "cheated" and simply disregarded the boot up sequency completely. If you want to see what's happening at that point, you need to connect a monitor to the standard Falcon video circuitry. Not really a problem for most users, I think. At least I've not had many complaints. ;-)
It would have been possible, though, to redirect the BIOS screen output to specialized routines in fVDI so that text output during boot up had indeed been working (after fVDI starts, that is).

>magic required to do this is rarely documented (even if you have full
>documentation - it took quite some work to get this working on the S3 Trio),
>plus it may depend on the special card and not only on the graphics chip
>(due to different types and amounts of memory, different DAC/clockgenerator

For the Eclipse/RageII we had the same problem (we never tried to get any VGA compatible modes working, but the hardware accelerated ones need similar configuration). Rather than writing an x86 emulator, we (or rather Sven in this case) simply "dumped" the card configurations from a PC and stored all the relevant values in the fVDI driver.

This is the main reason why the Eclipse/RageII driver only supports two specific RageII cards (it checks the PCI device ID), but it has not been much of a bother, really. Until last week, anyway, when I figured out that the problem a new Eclipse/RageII user had with graphics modes requireing more than 2 Mbyte was caused by his card having been user upgraded to 4 Mbyte and the RageII driver wasn't prepared for that...

>etc.), so using an emulation to run the BIOS that comes with every card
>certainly looks attractive.

If it is indeed true that many cards make do without much in the way of 386 code, I suppose it may be a workable option. I'm quite surprised to hear they do, though, considering how painful plain 8086 code can be.

The only time I've written x86 BIOS code, I jumped into 386 mode within a dozen instructions or two, even though that made it necessary to also be able to jump back to 8086 mode later. Made things a lot easier, IMO.

You need that. To get TOS up to the auto folder, the card must be able to do at least some basic 640*480 monochrome mode. Fortunately, once the card is set up by the BIOS, this can be done using standard VGA registers that work the same on every card.

Later on, the driver has to program the card for higher-resolution modes, but that is usually documented by the manufacturer (if you get access to documentation at all). Getting the card to a useable first state (like the BIOS does) may require access to undocumented registers to set up DRAM timing, bus mdoe etc..

>For the Eclipse/RageII we "cheated" and simply disregarded the boot up sequency completely. Not nice, but works. On the Milan, however, there is no other "primary" cideo output which we could use in the boot phase.

>For the Eclipse/RageII we had the same problem (we never tried to get any VGA compatible modes working, but the hardware accelerated ones need similar configuration). Rather than writing an x86 emulator, we (or rather Sven in this case) simply "dumped" the card configurations from a PC and stored all the relevant values in the fVDI driver.

This may work, depending on the card - some have write-only registers or
registers that can not be read back. We tried this on the S3, but it did not
lead to a working configuration without some additional tweaking.

Hello,

I've come into trouble trying to partition many IDE drives from 15 to
20 GB on both my CT60'ed Falcons and my C-Lab MK-I one.
I couldn't succeed so far.
So, could someone (owning CT60 if possible) please try the following :
1- prepare a boot floppy with HD-Driver 8(.16),
2- attach at least a 15 GB IDE drive,
3- boot from floppy,
4- set at least 16 partitions of 8 MB each,
5- try to install the driver,
6- try to access the partition menu again,
7- return here and tell us...

Thanks in advance,

J.-Luc - puzzled :-(

I used the same interface on CT2 Falcon.
If i got the interface new, it doasn�t work in CT2 mode.

Elmar modified the driver to the faster (CT2) rom port timing.
With the modified driver the interface works great on CT2 falcon.

I think you had the same problem.

Regards, Robert

Hi. I've got an 80 gig IDE Maxtor hard drive on my Falcon. I'm using v8.15 of HDDriver. I don't have it put back together yet, so what I say goes a bit from memory.

IIRC, I used partitions C through P, which is about 14 partitions. I made them almost the maximum limit under TOS 4.92. I believe it was something like 950 megs each. (isn't 1 gig the limit?).

This worked. However, again - if I recall correctly, at some point when I

```
was running HDDriver to set everything up, I had to reboot at least once
for everything to show up correctly.

HTHs.

I think I misexplained : the important is to know what happens when
creating more than 15 partitions, whatever their size should be - even
20 partitions of 8 MB would do.
Could someone please follow exactly the steps I described in the
previous post ? That would really help.
And, again, doing this on a Falcon would be better, and more if using a
CT60, as I suspect the problem doesn't exist on a Milan, Hades or with
an emulator.

Rebooting is required because otherwise TOS cannot access the additional
partitions, i.e. those that were not present before partitioning.
Rebooting is also required when the maximum partition size is bigger
than it was before. This in particular happens when the number of
partitions is reduced, which can result in some partitions having bigger

logical sector sizes than before.

One could say that in general rebooting is required after partitioning.

I would expect the same behavior on all machines because for HDDRUTIL
the machine type does not make a difference. HDDRUTIL does not know
whether it is running on a Milan, Hades or any kind of Atari.

Ah, my apologies, I misunderstood. Unfortunately, as I mentioned in the previous post, I don't have my Falcon back together yet to try what you want. :-(

What is the problem you are seeing/having?

>
> Thanks in advance,

Why so much partitions? U may use bigger partitions as 1gb with MINT. Almost no size limit. Also MINT allows more drive letter as till P: However, that may be a problem if u need TOSfs partitions. Im not sure if MINTs newfat file system supports larger partitions as 1gb... Maybe some Magic users can tell if there is partiton size limit. I am not fan of utils as Bigdos, they arent as safe as proper os and driver support....

Janez

P.S: Im using 10 and 12gb partitons....

That you just hardly ever see any STe machines for sale? Must be getting
rare as hens teeth (aside from the astronomicaly priced dealer models).

Hi,

Got a couple of files from the links on the info-zip websitr, no
zipsplit though.  I've worked around the problem now anyway.

Cheers
     Dave.

>   Why so much partitions?

Because I need so.

> U may use bigger partitions as 1gb with MINT.

I never said I use MiNT, did I ? So, forget partitions bigger than 2 GB.
In fact, I use MagiC! 6.20.

> Almost no size limit. Also MINT allows more drive letter as till P: However,
> that may be a problem if u need TOSfs partitions. Im not sure if MINTs newfat
> file system supports larger partitions as 1gb... Maybe some Magic users can
> tell if there is partiton size limit. I am not fan of utils as Bigdos, they

I need to use more than 14 partitions, and still be able to use the 14
first under TOS. So, it means size under 1 GB for the 14 first, and
under 2 GB for the others (MagiC! 6.2 has problems with greater sizes).
So, again, could someone try and follow what I asked, and tell me if
HD-Driver can or not create more than 14 partitions on a Falcon with
CT60 if possible?
The fact is HD-Driver ought to allow this, and on both my CT60'ed
Falcons and my C-Lab MK-I one, as soon as I want to have more than 14
partitions, the whole disks (I tried 5) become unuseable.

Thanks in advance,

Jean-Luc

Hi all,

As I've got rather a lot of questions to post I thought I'd better merge a few into one post. Appreciate these have probably been asked stacks of times but research on the net has not turned up the answers.

What's the quickest solution for transferring files from a PC to an Falcon/TT? I'm going to look into networking my Atari kit but that's a little way off at the moment.

Is the Backwards ST emulator program still available? Would love to play some of my old favourites such as Megalomania. I know that I could use a PC emulator but somehow that seems like cheating ;-)

Has anyone got upgrade disks for Hisoft Basic 2 & WERCS? I contacted HiSoft but was told the master disks have been lost. Currently using HB2 v2.02 & WERCS v1.24

There used to be stacks of PD suppliers (10 years ago) but most have seem to have dissapeared. What's the best place to download PD & Shareware(?) utilities such as ACCs?

Well that's probably enough questions for one post. Have to say it's great getting back into the Atari scene again and away from those Satanic PCs, even my trusty old Alpha workstation running OpenVMS has been consigned to the cupboard. :o)

Thanks in advance.

Dave.

I just received this rather late bulletin on Computerfest in Dayton, Ohio, this weekend. In past years this show was usually held in August and for a long time it was one of the biggest computer shows in the northeast.

---------- Forwarded message ----------
Date: Fri, 9 Sep 2005 20:57:05 -0400
From: Nancy J. Christolear (njc at dmapub dot dma dot org)
Subject: [Computerfest-Announce] Computerfest this weekend

It's that time again -- Time for the area's largest computer and technology show at Hara Arena, Computerfest(r).

When: Saturday, September 10, 2005 from 9:00 AM to 6:00 PM and
           Sunday, September 11, 2005 from 10:00 AM to 4:00 PM
Where: Hara Area Complex, 1001 Shiloh Springs Road, Dayton, OH

Computerfest: Still the area's largest computer fair, featuring vendors from across the country offering the widest selection of computers, computer parts, software, and seminars available under one roof.

Dayton LANfest: Having broken all records for the largest computer gaming event in Ohio, Dayton LANFest continues to grow into one of the top computer gaming venues in the nation. This show's LAN Party will feature gaming tournaments for the PC AND X-box. Over $3,500 in prizes and giveaways will be available to the 250 plus players expected to participate. Registration is $35 in advance at www.daytonlanfest.com or $40 at the door.

Intel is offering a rare opportunity to Computerfest=AE and Dayton LANfest participants.

Need a new PC? Ever wanted to customize and build your own PC using state-of-the-art components at a great price? Then come to Computerfest, where you'll be able to purchase and build your own personal computer at the Build-Your-Own PC Workshops sponsored by Intel.

Intel will be sponsoring 3 build your own computer seminars at Computerfest=AE. Participants will be offered the opportunity to buy parts for a significant discount and then walk away from the show with a computer in hand. See full details at www.computerfest.com.

Tickets for Computerfest are $7 at the door or $5.00 at our preshow outlets. Tickets are available on line at www.computerfest.com. They may also be purchased at various locations in the Miami Valley listed on the Computerfest website. Your Saturday ticket also gets you into the show on Sunday.

Computerfest Staff

I live 20 miles from Hara Arena and plan to attend mostly for seminars. I'm confused as to why this is being posted in Atari newsgroups. Other than SCSI drives I haven't seen anything relating to Atari for many years. It's a good show especially the free seminars but anyone expecting Atari is going to be disappointed. Correct me if I'm wrong.
IIRC their is an Atari show in Columbus this weekend.

> Thanks for the info. To clarify I meant the Videl is running at 50MHz (Bus 25MHz) and some monitors I have used allow significantly higher pixel dimensions that others when running true color mode for example.

Yes, but as long u stay within VGA boundary new CRTs will do just fine. Problems starts when u want to get so called RGB resolutions. Those use 15.7 khz horizontal clock, which is way bellow what VGA monitors can do (better ones craps at 28khz maybe, most cant go bellow 30 khz...) But RGB mode is usefull mostly for older demos and games, since its not eyes friendly in higher resolutions (640*400 etc...) If u need that, best way is to get Atari RGB monitor, or commodore 1084 or Phillips CM8833 (this one is preety cool, esp in v2, has composite and scart inputs, switchable.. u can also use it for consoles like Dreamcast, Playstation etc...) Or NEC3D or similar monitor. Hard to get good one these days...

MagiC supports FAT32 partitions, which can be much bigger than 2 GB.

I doubt that this has anything to do with the CT60, i.e. using a stock
Falcon would also be fine. I cannot reproduce this problem with my TT.
Creating 30 partitions on the same drive works fine for me.

The quickest solution is to share a hard disk drive by creating a
partition on it that can be read/written by both the PC and the Atari.
A hard disk will do for that, a drive with removable media, e.g. ZIP,
will do as well. A CF card can also be used, but this requires a CF card
adapter, of course.

   On Sat, 10 Sep 2005 at 05:23 -0000, T Shadow scribbled:
->I ... plan to attend mostly for seminars.

   The seminars are another good feature of this show.

->I'm confused as to why this is being posted in Atari newsgroups.

   Atari is a brand of computer.  Atari users are computerists.
This is a large show with lots of things that are of interest to
a great many computerists.  'Nuff said.
```

-> ... anyone expecting Atari is going to be disappointed.

That has been increasingly true of all computer shows and hamfests for more than a decade. But it isn't a good reason for Atarians to put their heads in the sand and to try to shut out the rest of the computer scene. There's still a lot at these shows that's useful to us -- or at least many of us (perhaps especially 8-bitters) -- and then there's always the possibility of finding a direct Atari item for a song.

->IIRC their is an Atari show in Columbus this weekend.

I noticed. After all, I'm the one who posted the information about it on this newsgroup!

```

Hello,

I wonder what happened with the author of Popwatch and Newswatch, Gary A. Priest. Is he still around?

I get more and more troubles to use Popwatch/Newswatch on my favourite OS. I can't use Okami/Popwatch to retrieve mails larger then let us say 25 KB. It seems my broadband connection is too fast for Popwatch. The newserver of my ISP demands user authentication. I know Newswatch supports this but it seems the newsserver demands something more, so I can't send out messages with Newswatch.

One thing I really want to see are newer versions of

Popwatch/Newswatch.

TTFN
Martin

I'm in the US. Was looking for a solid STe, if not too high priced. The dealers prices are pretty high, to say the least. :-)

Yes. You can get *new* monitors from a specialized place in the US (and I
believe it has an outlet somewhere in the UK), for svga monitors that will
sync down to RGB levels, but man, the prices! Something like $1300-1500
for a 15" to 17" monitor!

If ever win the lottery, I'll get one. :-)

Sure do miss the ability to run older Falcon demos and games, although
svga monitors are sharp and hi-res.

Hi,

C>I thought I would add that gzip a way to compress a single file. (A
C>.zip file is a container of multiple files that is compressed - with
C>.tar.gz files the TAR is the container, and the GZIP part is the
C>compression).
if someone is interested, I could provide a TAR.TTP running under TOS
which is able to handle both tar and tgz files. This port is due to
Hans-Peter, the author of OPTIMIZE.

Und TTsch�

Of course the information file used must be one that has worked before. You
want to try the one that came with the program as a start.

Hello Mike,

STZip 2.6 is ok, but it has some bugs. I use Arcview which is a great shell
program. It uses Unzip.TTP. I also have LZH,TAR and ZOO incorporated with this.
Works great...

Nowhere near as effective as it could have been. Posting something inflammatory in one newsgroup and then setting the follow-up header works much better, especially since a lot of people don't even notice where their posts are being posted.

It's a pity that Google groups don't implement a filter to prevent open proxies posting through their servers, since the source (148.244.150.52) is listed in a few DNSBLs[0] as an open proxy, as this post would have never been able to cause any disruption.

UPDATE:
I installed easyMiNT, actually I rushed an installation, but it went well. At the first shot I had a working environment (with some glitches, 16 colours, 640x480, and my auto PRGs didn't load) but Papyrus loaded JPGs immediately.

So, I assume, it is something connected with the TOS itself, or at least, the TOS routines that are replaced by MiNT...
Now I'll dig into MiNT to see if it can accomodate my needs, so I'll forgot plain TOS problems.

who knows...

In the meanwhile, thank you guys!

While irrelevant as far as .tar.gz files are concerned, and purely out
of curiosity, does it also handle .tar.bz2 files as well? Not that I've
ever seen them used for TOS/mint archives, there are quite a few in the
*nix world.

I'll give it a try, but would that solve my problem? It's still using
unzip.ttp (which I'm assuming is the same as the unzip.ttp included in
the unzip 5.1 archive? maybe not?)

Basically, both STZIP and Unzip cannot find any files in the archive at
```

all if I leave them as downloaded. STZIP shows an oddly truncated folder filename, and maybe a file or two, but nothing exists in the folder. Unzip simply says that the archive contains no files and quits. If I change the filename to be 8+3 instead of long filename (i.e. alpha.zip instead of alpha-04-september-2005.zip as is the case with the latest XaAES snapshot), then Unzip will actually recognize that there are files in the archive, but still won't be able to write them to the disk (there is enough disk space, and any other file unzips fine there). Not sure what the problem is, but it seems to happen most often with Mint-related items, and people who specifically program using gcc and other Mint-specific tools. Maybe it's something different between the way Mint's ZIP compression works as opposed to other TOS/Magic compatible versions? I don't know!

Thanks for your input!

For my ST the HD has to be switched on first, then the ST a few
seconds later and once the Desktop appears you have to reset it so
that it boots again so that is when it recognises the HD are you
resetting the ST after you have reached the Desktop the first time?

Also if booting off C is causing probelms hold down the key
representing a differect partition to boot from that one - might
bypass the problem file in the C drive that way.

And most of the other emulators won't run these other AESes and VDIs, I don't think? As for ABI problems, there are two ways around those - patch the emulator or patch GEM, and theoretically, I can do either.

> I think the better idea might be putting an effort into Aranym.

Most current emulators seem to be heavier than they need to be. :/ It should, in my opinion, be possible to run basic ST stuff on a low-end Pentium.

Except maybe of NVDI modern AESes or VDIs are not designed t run on
plain ST, which most emulators emulate.

Try TosBox then. I was able to run modern FreeMiNT and Naes on it.

For basic ST stuff you basically do not need modern AES or VDI.

No I've not tried that, will give it a whirl... Nope, booted to the
desktop and reset, ST tries to boot from C and fails as before.

>Also if booting off C is causing probelms hold down the key
>representing a differect partition to boot from that one - might
>bypass the problem file in the C drive that way.

Superb! That's done it. I held down the D key and it's booted from
that drive. Never realised I could do that... doh.

Many thanks
Dave.

Hi all,

Is there anything for the Atari that will allow a ZIP file created
using WinZip that is split into multi-parts to be put back together
again?

Cheers
    Dave.

This is a hugely different animal! NVidia releases binary drivers for x86
and x86_64! Guess what you use if you're on PPC mac? Unaccelerated FB
drivers! That's not good at all. There's actually marginal open source
ATI drivers out there. For our platform, ATI is the choice.

>> I still say that the Voodoo cards would be the best choice considering

Those cards are ancient. Asking my voodoo 3 to do 1680x1050 which I need
for my LCD would not go well. If we're going to do it, we should do it
right. Even if ATI cards have less support, they have the support we need
to get things up and running. They're VERY fast too. The eclipse makes a
stock falcon twice as fast. Just ask Carey. 128kbit mp3 on a falcon uses
over 100% cpu time at times. Accelerate BUS and CPU, add an eclipse card,
and it uses somewhere around 30-40% (with DSP). It's important to let the
devs choose what they're most comfortable with, and I'd say ATI is it. We
want to get a product sometime this century.

Thanks,
Mark

To quote from my old friend Eric Hays:

"The latest version was dated April 18, 1991 (at least, that was the
latest
I ever got) and does indeed run fine on the Falcon, even in Falcon
resolutions, although I think it crashes in modes above 16 colors. "

I've often run WordPerfect on my stock Falcon under Geneva in 16 color
mode.  I tried it on my CT60, but it crashed.  This may have to do with
the fact that my CT60 was in 256 color mode at the time.  In any event,
I use WordPerfect very rarely nowadays, as Atariworks handles all my
typing needs now that I'm no longer writing research papers.

O.O

You can play mp3 in realtime on a 68030?  In the DOS world, I've never
heard of anyone playing mp3 on less than a 486/66.

Then again, '030 would clearly pound a 386 flat.

Yeah Mike that happens to me also. Here is what I do to get around it. First I
unzip the whole file. I will get folders that have nothing in them. I then go
into the folders in the ZIPPED file using Arcview and highlight their
contents and another unzipp function and the files then appear. If anyone else
has a better fix, I am all ears.

I can almost get a 128k mp3 to play on a 16Mhz Falcon. (There's too many pauses and stutters to say I've truly done it.) On accelerated Falcons it's quite easy.

Has anyone managed a 128k mp3 on a stock Falcon?

Galen

I'm looking for a flexible 17" Monitor (brand name and model so I can source locally) for a CT60 that can handle a broad range of resolutions and refresh rates etc. I'm using Centscreen 3 with 50 MHz bus. Any thoughts would be appreciated.

Thanks.

Okay, thats why I asked, to get some input/debate on the subject. I am now "educated". <grin>

Nvidia also has a non-proprietary driver used with Mandriva out of the box so its GPL legal. The catch? No solid 3D acceleration (some, but not enough for top end games 'n stuff). You probably already knew that though.

>>> I still say that the Voodoo cards would be the best choice considering the amount of documentation available, but what Didier does is his choice.
>>
>> The Voodoo 3000? I've still got one of those. It was the first video card I ever used with Linux, mostly because of its great support, out of the box, at the time.
>
> Those cards are ancient. Asking my voodoo 3 to do 1680x1050 which I need for my LCD would not go well. If we're going to do it, we should do it right. Even if ATI cards have less support, they have the support we need to get things up and running. They're VERY fast too. The eclipse makes a stock falcon twice as fast. Just ask Carey. 128kbit mp3 on a falcon uses over 100% cpu time at times. Accelerate BUS and CPU, add an eclipse card, and it uses somewhere around 30-40% (with DSP). It's important to let the devs choose what they're most comfortable with, and I'd say ATI is it. We want to get a product sometime this century.
>
> Thanks,
> Mark

They are ancient - I guess it was mentioned because there are such good docs 'n stuff.

But...I agree with what you are saying Mark. Since we don't have unlimited funding/numbers of developers, then its probably best to go with the highest performance card that actually has a decent chance of being coded for TOS/MINT.(and of course, as has been mentioned, whatever the actual person doing the work is comfortable with).

Thanks for the input! :-)

I can do it. If you have trouble, just set it in ST-High resolution.
It'll play no problem then. Tweak the aniplayer settings too. It's
designed to work on a stock falcon.

Thanks,
Mark

Well, according to docs I read on the 'Net, they recommended the root of
your C drive. Which is what I did. I don't believe it was STING.INF that
the file selector asked for though, it was something like STING.PRG?

Thanks.

One problem with that... it's an RPM file -- no way to unpack it with Magic. And I just can't get a usable full Mint setup (even with EasyMint) in order to unpack it with that. If someone is willing to e-mail the binary to me in a form that is usable under Magic, then I'll definitely try it! Please use the address below my signature. Thanks for your suggestion, though!

Argh, let me correct that - I meant to say the file selector asked for
"STING.PRT", not "STING.PRG"...

I'm going to bed now. :-)

I would guess that this tuner has video signal output, if it is meant
to be used with a monitor and so would not have a TV RF output as such.

The Milan PCI bridge can be set for both big and little endian modes - for CPU->PCI accesses, both are available to the software in separate address spaces, so that a driver need not swap in most cases.

>The result is the sound that the milan
>blaster is in intel format :-(So It's not the best choice.

The problem is PCI->Memory DMA access: you have to cope with situations where the byte-order is externally defined - for example a SCSI card with a CD-ROM. If the SCSI card reads a sector from CD and writes the data to memory, it uses 32-bit memory writes. Since the PCI bus is always little endian, you have to setup the bridge so that the bytes end up in memory in the right order - otherwise, the CPU would have to swap every sector read/written, which is unacceptable performance-wise.

Unfortunetely, this also affects sound - you can only set one endian mode for all cards together.

cu

Try this one :
ftp://chapelie.rma.ac.be/atari/archivers/zip20.lzh

It works perfectly and is faster than STZIP on CT60.

Cheers
St�phane

fVDI itself should certainly work, but the RageII driver currently does
not. I tried to get it up and running on a Milan some years ago but ran
into some kind of problem accessing the card. This was testing and
debugging via email, though, which isn't the most efficient way to go
about things.  ;-)
(I don't have access to a Milan or Hades.)

It would have been very nice to have that feature on the Eclipse, but
the CPLD used for the PCI interface didn't have room for anything fancy.
So, the current RageII driver ends up doing a whole bunch of byte
swapping, unfortunately (not that it matters much when the Falcon bus
is usually the performance limiting factor, anyway).

I wonder if that might have been the problem I had with fVDI/RageII on
the Milan, which I mentioned above?
AFAICR, there's no support in the Atari PCI BIOS "standard" for reporting
separate address spaces for separate uses (the Eclipse has a similar
separation for 16 and 32 bit accesses if memory serves me right).

There seems to be pretty decent open source nVIDIA driver support out
there too. Perhaps not for Linux (haven't checked), but under BeOS they
even have rather good 3D performance, apparently.
QuakeII is supposed to be running, along with other OpenGL things.

See here, for example:
http://web.inter.nl.net/users/be-hold/BeOS/NVdriver/bench/bench_v041.html

>>> I still say that the Voodoo cards would be the best choice considering
>>> the amount of documentation available, but what Didier does is his

Documentation is definitely much nicer than X sources. ;-)

>Those cards are ancient. Asking my voodoo 3 to do 1680x1050 which I need
>for my LCD would not go well. If we're going to do it, we should do it

Are you sure?
I'd be very surprised indeed if a Voodoo 3 had trouble with resolutions
like that. Even the (far more) ancient RageII used with the Eclipse can
do 1600x1200 (only at 60 Hz, but that's enough for an LCD, and not at
32 bit colour (too little memory and possibly bandwidth)).

Someone else commented that even a CT60 would have trouble throwing
around the data for a mode like that, but that's missing the point
completely, in my opinion. There are very few situations where you'd
actually want or need to do anything much with the CPU for all those

millions of pixels. Usually you'd let the hardware acceleration work
for you, and that is very very fast indeed.

>right. Even if ATI cards have less support, they have the support we need
>to get things up and running. They're VERY fast too. The eclipse makes a
>stock falcon twice as fast. Just ask Carey. 128kbit mp3 on a falcon uses

I suppose that number is related to the fact that you can set the Falcon
to monochrome mode and still get colour graphics (so that more of the
bus bandwidth is free for the CPU)?

>devs choose what they're most comfortable with, and I'd say ATI is it. We

As someone said, anyone is of course free to write a driver for some
other hardware. It really isn't very hard to do (assuming you have
decent documentation or equivalent).
I'd really like to do one for the Voodoo cards myself, but I'm not sure
I'll ever find the time for that.

There's a command-line utility which can split a ZIP archive into several
valid little ZIP archives, it's called zipsplit (part of InfoZIP, IIRC). I
have no idea if this tool has been ported to the TOS platform.

This is a shame that even the PCIBios can not inform driver about the bus endianness. It means drivers have to be modified for each hardware (milan/hades/eclipse/ctpci), right? I would not want to code a driver when the hardware can be different. I know that endianness has changed in latest pcibios revisions.

Michael, as you worked on various Milan drivers, could you tell us more about the vga part? Is there a generic VGA driver in Milan Rom that can be used on any card that support VGA modes (i.e up to 64K) ? Could it be modified/adapted to run on eclipse, hades or planned ctpci hardware?

Maybe voodoo5. I remember my voodoo 3 (even the 16MB version) having a
1280x1024 limit. The voodoo5 was a nice card. It'd be nice to see
drivers for that ;)

The more choice the merrier. I'd prefer ATI drivers for quite new cards so that as hardware acceleration is done, it's quite fast. Considering ATI stuff is a proven concept, I thought it made more sense, but the bottom line is whatever, the people developing the (likely free) drivers want to use they should get to use without any whining ;)

Thanks,
Mark

Hi Mike!

I don't know if you know, but there are later versions of both: ZIP23_02 and UNZIP540. Usually I use ArcView which calls UNZIP540.TTP, or sometimes 2-in-1 which calls ZIPJR.TTP. So far I haven't come across any ZIPs which one of these didn't handle (but I haven't tried to unzip any of those mentioned above).

I am not sure of your question, but ANY recent VGA monitor can handle Falcon resolutions (including Centscreen or Videl Insile ones).

The better the monitor is, the higher refresh rate you can get.

As for the VERY LOW resolutions, I think you'll need and old Nec Myltisync 3D (it was great!)

Hope this helps

Hi J-Luc!

I use this program on the Falcon and it works fine. Note that you
need both SPLITTER.TTP and SPLITTER.PRG in the directory (I think
the PRG is a GEM shell that calls the TTP to do the actual work).

But are you sure that the splitting process with WinZip is the
same? Is the same index/CRC file generated (or at least one that
Splitter understands)?

Hi all CT60 users and atarians!

The registration period for the EtherNat ends today and now it's time to give you info on how to prepay us for your orders. Of course anyone can order an EtherNat now even if they missed the registration period. We hope you'll understand that we have to request pre-payment to make sure we won't go personally bankrupt because we've produced more boards than we can sell...

First of all you must fill in the form below and email it to us. In the form you choose how you want to pay for your order.

The easiest way (and a very safe way) to pay us is via PayPal. Simply sum up the total of your order including packaging and postage and add 4% to that (to cover the fees that PayPal requests from us when we withdraw your money). Then send that money (in EUROs) to "hencox at hotmail dot com". We'll check that your payment is according to your order and then confirm your order via email to you. Please give us a few days to confirm your order, since we will probably receive many orders the first few days.

If you want to pay using bank transfer (easy within Sweden) make a corresponding mark in the form below, and we'll email you the necessary details.

You see below the necessary information to calculate the total cost of your order:

Within Europe (EURO):
Price of 1 EtherNat: 125 (non-EU countries: 100)
Shipping for 1 - 2 boards: 16
Shipping for 3 - 4 boards: 20
Shipping for 5 - 8 boards: 26

Rest of the world (EURO):
Price of 1 EtherNat: 100
Shipping for 1 - 2 boards: 17
Shipping for 3 - 4 boards: 21
Shipping for 5 - 8 boards: 28

Within Sweden (SEK):
Price of 1 EtherNat: 1175
Shipping for 1 - 2 boards: 88
Shipping for 3 - 4 boards: 99
Shipping for 5 - 8 boards: 110

Fill in this form and email to us:

First name:

Last name:

Full address:

```

  **********************************************************

                         **archivers**
ftp://chapelie.rma.ac.be/atari/archivers/jaymsa18.lzh
   (122.218 bytes): JAY MSA is clone of MSA (Magic Shadow Archiver) program.
    This type of programs archives whole floppy discs. The result is file,
    in which are stored tracks of the floppy disc as it is on physical medium.

                           **game**
ftp://chapelie.rma.ac.be/atari/game/pmheretic-0.46.zip
   (327.140 bytes): Atari port of Heretic

ftp://chapelie.rma.ac.be/atari/game/pmhexen-0.46.zip
   (381.642 bytes): Atari port of Hexen

                            **mint**
ftp://chapelie.rma.ac.be/atari/mint/misc/sdl-devel-1.2.9-mint.tar.gz
   (559.985 bytes): Simple DirectMedia Layer (SDL): This is the Simple DirectMedia
Layer,
    a general API that provides low level access to audio, keyboard, mouse,
joystick,
    3D hardware via OpenGL, and 2D framebuffer across multiple platforms.

                          **programming**
ftp://chapelie.rma.ac.be/atari/programming/ldg-2.32.tar.gz
   (501.132 bytes): LDG stands in french for Librairies Dynamiques GEM or in
   english GEM Dynamical Libraries. It is a protocol allowing GEM application
   to load and share libraries (or plugin if you prefer).
   The goal of LDG is to provide some usefull functions to the GEM applications
   like the WinDeath DDL.

ftp://chapelie.rma.ac.be/atari/programming/gfa-basic/gbe.zip
   (201.420 bytes): is a GEM based editor modeled after the orginal GFA-Basic
editor.
    Runs under a multitasking system like MiNT.

ftp://chapelie.rma.ac.be/atari/programming/gfa-basic/runonly.tos
   (146.390 bytes): GFA-Basic interpreter which can be used stand alone or with
GBE.

ftp://chapelie.rma.ac.be/atari/utilities/desktops/tera362b.zip
   (283.407 bytes): Tera Desktop (TeraDesk) is a replacement for the ST, STE or TT
desktop.
   It provides more facilities than the built-in TOS desktops.
   TeraDesk is currently the only open-souce desktop available for 16-bit and 32-
```

bit Atari computers.

Have fun,
Martin

I once tried changing the Memory settings (under the Options submenu) in Papyrus while running it on my CT60, and I got all kinds of errors. This setting may be what the person meant. I returned all the settings to the original "factory" settings, and everything works fairly well (I still get an error or two from time to time, but not nearly sa often).

Hi,

The TOS boot Radeon driver (VDI / XBIOS) and radeon.sys for fVDI is in
progress. Time remaining, one month I think + time for test / debug with
the hardware (today just planed).
PCI (X)BIOS is already finished.
The CTPCI + Radeon 7000 /7500 seems the best choice.
The TOS PCI drivers are loaded inside the flash between 0xED0000 and
0xEEFFFF (128 KB) with the CT60 Flash tool (HEX S-record format).

Regards,

Didier.

Can you put pictures of the prototype on your page?

Hi all,

Just setting up a Gasteiner HD with an Atari 4160 STE. I've formatted all the partitions, and copied a few ACCs into the auto folder along with the Little Green Selector (LGS) program. Problem is that LGS causes the ST to freeze on bootup and as C is now the boot drive I can't get into disable it. I tried putting a disk in to the A drive but the ST keeps trying and failing to boot from C.

Can't even get in booting from the Gasteiner disks either.

How can I get back into the C drive and disabled LGS?

Dave.

So,

Should we begin shopping for radeon 7000/7500 PCI cards?

thanks,
Mark

I don't know, maybe Rodolphe want to build a package.

Regards,

Didier.

Heuu.. I said "the hardware (today just planed)".
Like you (?), I must wait for a CTPCI.

Regards,

Didier.

>
> Dave.

Which hard drive software are you using? With HDDriver, and most of the other HD software, you can use a keypress combination at bootup to achieve various things.

Try holding <alt>, <control>, and <shift> in various combinations at boot time. It works, I've done it before as well. I just can't remember the -exact- combinations right now. <grin>

Try them one at a time first, then try 2 key combinations like <control> and <shift> together at the same time.

BTW, sometimes just because it freezes at a certain point, doesn't necessarily mean its the last thing you see on the screen. It probably is what you said, but once you do get back in, be prepared to disable all your ACCs and add one at time back, until you find the exact culprit.

HTHs. :-)

Its in the ROM. Pressing and Holding ALT at boot time will bypass
booting from harddisk, and boot from floppy.

Coda.

this is just a stab in the dark solution but...find which harddrive software
goes with your drive and re-install it using the right setup.
mine was a"FAst drive" so i located some "FAst"utilities and installed
drivers in no time.
charles

Hi all,

For the first time since back in May this year, there is now a new development snapshot of XaAES available. Quite a few things have been improved and polished up and the new version is definitely worth a closer look!

Amongst other things there is now experimental support for using texture backgrounds for window widgets as well as support for changing resolution from within XaAES. Add to that a comprehensive list of bugfixes and optimisations and at the end of the day you get a more mature and polished AES. Especially users that wants to use XaAES in monchrome mode should pay close attention to this release.

Visit the Un-official XaAES Page to read more and download the development snapshot: http://xaaes.atariforge.net

Regards,

Joakim

Hopefully you are using HDDriver. Just boot up the STe using a floppy so all you get is a desktop with the A and B drive icons. Then run the HDDriver program and install the C hard drive icon. You should be able to get in and ajust what needs to be adjusted. I do it all the time this way when I have a booting problem.

Mike you might do what I do. I keep a copy of the information file in a separate folder. Then if Papyrus starts to act up, I just copy that onto the inf file that Papyrus happens to be using.

Hello all !

New version of MyMail 1.83 released.

Major improvements & bugfixes:
-----------------------------
   - Lots of corrections to fix stability problems.
   - Added question about server delete of mail that are marked for
delete.
   - Minor document updates.

   Read more in the history.txt file.

Download from:
--------------
 http://www2.tripnet.se/~erikhall/programs/mymail.html

Best Regards
Erik H�ll

First, thanks to all who responded.

Pressed the Alt key as suggested and did indeed manage to get in and remove the offending ACC. This seemed to work once, now when booting from the HD the system freezes up with the following displayed on the screen.

```
HHDriver V6
ACSI 0.0 Seagate ST1096N
Partitions C-K, Boot Drive C
27kb.
```

Pressing any keys now gives two bombs. Tried leaving the system at the 27kb prompt, came back an hour later and it was still the same.

if I use ALT to boot from floppy the STE is unable to see the HDs either by adding them onto the desktop or running HHDriver.

I'm wondering that if I plug the Gasteiner mega drive into a Falcon, could I use HHDriver to mount the HDs and wipe out the entire AUTO folder...?   Is this likely to work or would the Falcon try to boot from the "fried" Gastiener instead of it's own internal C drive?

I was trying to setup up this STe / HD combination so I could do a test run of installing MiNT - Didnt get very far :-(

Dave.

You know some people have no life, and sometimes want to bore a whole
newsgroup. That's easy: go start flame wars or post insanities to 10 or
20 other active newsgroups, crossposting with the newsgroup you want to
annoy.
Within a few days, hundreads of messages will flood the newsgroup you
don't like.

Cheers,
Simon.

Okay, I'm a complete newb and utter ID-10-T when it comes to this stuff, so forgive me if I ask something really stupid, but...since its MINT, and Nvidia video cards are so well supported under Linux, wouldn't a cheap Nvidia card be an option?

Just wondering... Thanks! :-)

PS Or is it because Nvidia Linux drivers are still proprietary?

Depends on your view of "unsupported". :-) Nvidia releases new updates for their cards on a very regular basis, and are much easier to work with than ATIs stuff, at this point, going by the messages I read in the Mandriva mailing lists. Just wish they would open source their stuff. Sure would make a lot of people happy. :-)

The Voodoo 3000? I've still got one of those. It was the first video card I ever used with Linux, mostly because of its great support, out of the box, at the time.

Wheres the problem?
someone else can write VOODOO drivers as well, I supposed that there is no
problem because all of these will be only compatible with GEM.

Yes, it's not a problem, if someone can bluid a VOODOO drivers, please
contact me. The limit is just the 128 KB of the flash. But if space is
needed I can remove the boot picture and get another block of 100-128KB.
You must also create a driver fVDI compatible who can also can be called
by the flash, use gcc and gas, so please contact me.
If you use Linux sources, we can also use common resources for get space
like the framebuffer functions (cleaned of kernel linux calls).

Regards,

Didier.

Today I don't know, if fVDI works on theses machine why not, but I think
use the CTPCI in big endian (today there are a define inside the PCI
(X)BIOS). So the radeon driver is little endian whith a result in big
endian. On Milan I think than the host bridge is big endian and the ati
card is set for swap bytes. The result is the sound that the milan
blaster is in intel format :-(So It's not the best choice.
I can try to put a test inside the radeon driver because the PCI (X)BIOS
return the endian format.

Regards,

Didier.

I'm trying to write a rather unusual type of ST emulator, and would need a little knowledge on the internals.

All I really need to find out is how to load a program into 68K space and run it, and how to convert ST GEM and TOS calls to native calls. The resulting emulator (I'm thinking of calling it CrySTal) is just going to be a way to run some Atari ST stuff on a PC which is already running GEM.

GEM on the PC does not support more than 640 MB of memory, does it?
Since a GEM application for the Atari can allocate large chunks of memory
without any tricks, the fact that it does not work this way with GEM/3
for the PC could be a showstopper.

If I use DJGPP I can work around the 640K limit. (This was my plan.) PC
GEM might not support it, but the compiler does, and the CPU core will be
running outside the 640K area anyway.

Alternatively, it may be possible to boot without the hard drive
switched on, then start it afterwards. You should have your HD
software disk in A:\ and run the installer again - or just the HD
driver, then put a new C:\ icon on the desktop. This /may/ allow
you to access the partition to remove LGD.

Note that ACCs do *not* belong in the AUTO folder, but the root
directory of C:\! Possibly that's causing the problem?

Regards, /Peter/

There are other problems I encountered when I wrote an application
running on GEM/3 and on the Atari long ago, using the latest (i.e. last)
release of GEM/3. The order of calls for certain functions (setting
window attributes, for instance) should not matter, but under GEM/3 it
actually does matter and changing the order sometimes led to crashes.
Since I could change this order by changing my sources I could address
this problem, but you cannot do that. So don't be surprised if something
does not work even though an application does not do anything wrong.

In general my experience with GEM/3 was a bad one. It was instable, not
always compliant to the specs, and if I had not had the stable Atari GEM
to run tests on and to debug I would not have been able to get my
application running on the PC.

I actually can probably do this, by manipulating the incoming GEM calls
before passing them on to GEM.

Hopefully FreeGEM (my actual target) is more stable than stock GEM/3.  If
not, well, the source code is out there and I could probably try to fix
it.

PC GEM is lagging in features behind modern Atari GEM replacements
(Magic, Xaaes, Naes), and will be unable to run modern programs (lots of
them depend for example on NVDI). Moreover there may be some ABI
incompatibilities (not only endianess).

I think the better idea might be putting an effort into Aranym.

Hi Peter,

Tried recnnecting the HD once the ST had booted from drive A, could not add an icon to the desktop & HHDriver also could not see the partitions.

Hmmm, yes I remember now that the ACCs should go in auto folder, like you say this could be the problem.   Am going to try connecting the HD to a Falcon and if I can mount the drives hopefully I can remove the offending items.

Dave.

Hi!

I currently use STZip 2.6 and unzip 5.1. Those seem to work for most things. However, recently these have not been able to unzip some things - specifically FreeMint kernals, XaAES snapshots, and anything from Patrice Mandin. What do people use to get those? I normally run Magic 6 because of various problems gettin Mint working right, as well as it's horrible lacking of a good GUI. Can someone please suggest something that would work for me on that OS? Thanks!

Hi Ronald,

Thanks for the info, I'm going to try MiNT on the TT. Must admit I didnt like Thing all that much, the bit I saw of it anyway. Is it still supported because the version I had was unregistered shareware.

Cheers
     Dave.

Anyone using Iomega 250mb ZIP drives on an Atari? There's load of cheap SCSI ones on Ebay. If so I'm going to curse! I gave one of these away about 6 months ago :-(

Sometimes software is harder to remove than to install :-).

Hmm, I don't know if its *officially* supported. I believe the author was released it now and doesn't require a registration anymore. Someone will correct me on this if I'm wrong.

Can you say specifically what it was that you didn't like about it? I have to admit, after going from a plain TOS desktop, then to Neodesk/Geneva and then to MINT/Thing, it took me a while to get used to it as well. Its very robust. There are lots of options, which can be confusing at first, but you're better off in the long run.

Actually my impression is that removing software is not the problem with
Windows, but getting rid of orphaned menu items and registry entries...

Hi Janez!

Yes, you're right. But it doesn't seem necessary to have Thing
entered there - mine runs without that under MagiC.

Without MagiC, Thing can also be installed as an application to
start automatically. From the HYP:

```
-------
 1) Select file THING.APP
 2) Select 'Install Application...' (or similar function in your desktop)
 3) A dialog box appears to register THING.APP.
 4) Set 'Boot Status' to 'Auto'
------
```

and there should be a

 5) Save the desktop!

If he has done that, then a renamed Thing folder will give rise to
complaints as described. The remedy is to remove the line such as

```
 #Z 01 D:\THING\THING.APP@
```

from DESKTOP.INF or NEWDESK.INF.

Regards, /Peter/

I can't display JPEG images with Papyrus and CT60 in 060 mode.
I tried the demo versions and my latest version (PAP X), and it's exactly
the same: instruction error everytime a JPEG appears.

Everything works in 030 mode.

I tried clean booting, and it's the same.

Any hints?

Thanks in advance

Paolo

A 68060 lacks a few instructions.
Look out for a software package that emulates them.
I dont have a name.

Such a package should be part of the CT60 deal, it also emulates
a series of lacking floating point instructions.
Check if such a package is installed.

I dont have a CT60, but I know this from the MC68060 manual.

Dear Classic Computing and Gaming Enthusiast,

Buy, sell, trade, play, and see classic video games, computers, peripherals, memorabilia, and more at the Classic Computing and Gaming Show (CCAG) on Saturday October 22, 2005 from 2:00 P.M. until 7:00 P.M. at the National Guard Armory, 3520 Grove Ave. Lorain, Ohio. Vendors, clubs, and collectors will be displaying and selling their retrogaming and retrocomputing goods, from Pong and Atari to Nintendo, Apple and IBM to Commodore and everything in between with many set up for you to play with and explore.

And once again, it's free, that's right absolutely *FREE*, for attendees and dealers!

We have 5000+ square feet of space. Help us fill it all up! (The price certainly can't get any better. :)

Get the latest information on our website, www.ccagshow.com, or write us at info@ccagshow.com. And don't forget to spread the word!

We'll see you there. It's gonna be great! :)

- The CCAG 2005 Committee

Looking to buy Turbo Synth for the Atari ST series.

Would like to get the whole package with box, manual, disk(s),etc.

If you only have the disk or disks, then I may still be interested.

Contact me at:

phantomm@bellsouth.net

If You have Turbo Synth for sale.

Thanks,

```

Hi,
The Falcon I bought has a registred version of MagiC 5 on it and that works fine, it also had an unregistered version of Thing which displayed "Shareware" all over the desktop. The shutdown option from within Thing always "hung" when powering down.

I kept getting a message on boot up saying opened windows would not be saved in this shareware version. That coupled with the fact that I dont have the install disks and could not find it on the net prompted me to disable it.

Are the installation disks available anywhere on the net?

Dave.

I use an HP 430c Inkjet with my Atari TT030, just use it in plain text mode
and it works just fine.

> cheap SCSI ones on Ebay.  If so I'm going to curse!  I gave one of
> these away about 6 months ago :-(

  Well it was a mistake then ;) I don't use Iomega, but Syquest, but
there is no problem if u want to use Iomega. In generaly SCSI HDDs,
CDrom and exchangables feels quite happy with Ataris... On other hand
if u want to use Atari more as for gaming, 250 may be tight anyway .)

   Thing need a short period to get used to it. It is not emediate eye
```

catcher. Also supplied icon set isnt that nice, but u can change those easily... Strong points are shown later: thing groups is great feature, also Things "application" dialog is very good, fast acces to apps, and "sendto" feature are also very usefull. Also offer good support for TOS and Unix (minix and ext2 used in MiNT) filesystem. Also skiping folders is nice, but sometimes i miss "spring folder" feature as in Jinnee, but thats rare.. It is also great AVSERVER, so offer nice features in multi tasking envoirments...

Janez

Of course.. But the guy said that Xboot gave that error line.. That was prolly a mistake, since as it seems, TOS did :)

So u dont know, that CT60 TOS take care of that :) Anyway, all works perfect here, Papyrus 8 though. I would say that Paolo has FPU less 060 maybe?

It's a complete 060.
I am running it at 95MHz.
(I had the same problem before Rodolphe Czuba upgraded it from a 50MHz)
```

Someone else suggested to try the TT bit with the fileinfo utility (nothing happened)
Someone said it could be because of too much memory (I have 256), but I don't know how to 'reduce' it.
Another option was the speed of CT60 (I didn't try this one yet)
And another sugout the JFIF module (I have to try the TruePaint one, I need to search.

In the meanwhile, thank you guys!

Other have already explained what tar and gzip components do, but maybe some words would be usefol on why it is beneficial to execute such a procedure: it comes to advantage when a (large) number of files containing identical or similar data segments are packed. Tar conveniently puts all files into a single .tar archive, and then the compression algorithm in the gzip part can compress identical sequences which appear in different source files, and also compress the archive directory, etc. This can result in a compressed archive which is noticeably smaller than if compression was done on each source file separately as, for example, in zip.

When a single file is to be compressed, differences in compresion ratio vs. some other archivers are more-less academic.

>I assume gz is GZIP and like any other ZIP, but what
>does tar do?

Btw. as far as I know 'gzip' format is not identical to 'zip' one, though it is based on similar principles.

Hi,

B>I'm specifically looking for info on which HD program (format /
B>partition) I need to use.
most of the programs running on an ST will run on a TT as well.

B>Is it possible to put a TT or Falcon on a home network (router) and get
B>access to the www?
I run a TT, there's no PC in my home and I intend to go on doing so as
long as my TT won't die..
Access to www is a bit slow, my opinion is: It's ok to look at a
certain page, but I think surfing with a TT is boring.

> patched Pure C.

The patch is in the aranym cvs.

> I'll see if I can find the topic in my NG/ML archives.

From the aranym Mailinglist:
-------------------------------cut------------------------------
PC.PRG can work with files in memory (opened windows). Unfortuantelly it uses
file handles between 100 and 140. MetaDOS maps the opened files just from the
value of 100. So, the solution to make PureC working with MetaDOS or BetaDOS
would be to patch them of PureC.
.
.
.
I've been investigating the MetaDOS filehandle numbers and I've found out
that MetaDOS can only open 100files simultaneously. So I've made a patch
to let PureC use the handles from 200 to 240 for memory buffers. The
patching prgram is in src/atari/tools/pcpatch.prg.bz2 (pcpatch.c).
-------------------------------cut------------------------------

Hallo Ronald!

RJH>I saved, both general and address to STING.PRT, in the C hard drive.
RJH>Doesn't make a difference though, if I reboot, I have to use the CPX
RJH>again.

Which control panel are you using? IIRC there were issues with Cops. Try ZControl or the original from Atari instead. Just for saving, in normal operation there should be no problems with either one.

With best regards
Ekkehard

I can go along with that. I use COPS on Hades which seems to work fine, but on my STe I use the Zcontrol panel.

I sometimes get errors when I boot up Papyrus X on my Hades 060. The thing
that works for me is either boot the computer under regular TOS or else boot
it in the 256 color mode. I usually run things in the 24-bit mode.

Thanks Gerhard.

But what about no-user MinT setup on real TT or Milan which
does not involve m/betados?

Thanks very much to all who replied to my query here and by mail.

I hadn't realized gz only handled one file at a time, unlike ZIP
on the Atari (or WinZIP on a PC?).

Regards, /Peter/

I use PureC almost daily, but under MagicPC. The only problem I know ab=
out
is 'Save as'. There you never know which file is saved. So better never=
 use
it.

The new release of ExtenDOS, ExtenDOS 4, is now available. It features
DVD support, improvements to the audio CD player (including use of a
local copy of the freedb database) and a fully-integrated version of
UNIMINT.XFS for use with freemint. Further information is available
from the ExtenDOS 4 page at:
  http://www.anodynesoftware.com/e4/main.htm
or:
  http://www.cyberus.ca/~anodyne/e4/main.htm

Howdy,

I'm having issues with COPS in Xaaes/FreeMiNT 1.16.0 - 1.16.CUR.

Cops starts up, but crashes when it loads CPXs. Doesn't matter which
CPXs, and fooling around with the memoryprotection settings doesn't
help either. I've tried starting it both as an APP and as an ACC.

I can ofcourse use zControl, but I want to use COPS.

Any clues?

regards

Probably Cops does not flush 060 caches after loading CPX.

OK, now I'm confused.

If your computer has address 192.168.0.104, wouldn't

0.0.0.0 0.0.0.0 EtherNet 192.168.0.104

serve to send all data packets back to your computer?

Galen

Looking for Non-Working Atari Falcons.

If you have a Falcon that doesn't work anymore and want to
sell it. Contact me at the e-mail address below.

Also, I may be interested in a working Falcon, depending on the
condition and if it has been upgraded or not.

If you have one for sale, contact me at the e-mail address below.

Also interested in 3rd party hardware for the Falcon of all types.
Working and Non working.
Contact me at the address below if you have Atari Falcon hardware
to sell.

I am located in the USA, and will buy from OverSeas and CANADA.

E-Mail me a description of your item and asking price to me at:

phantomm@bellsouth.net

Thanks,

> It seems I need Discus for many things, and Hypercopy to tell me what is wrong with a disk format. Still no word from the author about registration.

One can do all kind of things as far as formatting floppy disks is concerned. "Add Headers" thus can mean a lot. Old versions of DISKUS offered special formatting features where you could influence the number of bytes written to certain locations within a track, or analyze a track layout. These features are not available in the current versions anymore because they only work with the Atari floppy hardware and not with emulations like MagiC or with the Milan. Besides that, execpt for creating track formats not compatible with any platform these functions were not really useful, and so I removed them. (Registered users can get an old version of DISKUS, of course, where these functions are still available.)
Anyway, obviously it does not need complicated options to format a floppy with DISKUS in order to be readable on a PC :-).

Probably u use the original AES (built in tos), since every AES I can think has "AES" in its name (NAES, XAAES, OAESIS, etc..) I've NAES and there is a cfg file of it which tells him which desktop to start automatically. Since you have the original AES my only idea is the desktop.inf file. Applications also can be started from this file. Try to rename it.

Actually who complains about the missing Thing? Is it XBOOT? Or something after XBOOT? What happens if you disable XBOOT?

nope, about 5mm too long :-(  you need a port extender.  that's my
prototype.  :-)

Chris's board fits under though.  :-)

Would it be possible to mount RS232 connector on one side and PS2
connector on the other side? Mouse could be directly connected to PeST.
Did you know, that the easter part of Budapest is called Pest?

Yes I'm from Hungary. Joe Iron is the translation of my name (Jozsef
Vas):
Jozsef - Joe
Vas - Iron

No, there is no meaning of Pest. It is just a name.
